VANASPATI

PLANTS AND PLANT-LIFE AS IN INDIAN TREATISES AND TRADITIONS

Griffith Memorial Prize Essay for 1925

BΥ

GTRIJA PRASANNA MAJUMDAR, M.Sc., B.L. PROFESSOR OF BOTANY, PRESIDENCY COLLEGE, CALCUTTA

PREFACE

My thesis on Plants and Plant-life as in Indian treatises and traditions, submitted and finally approved for the Griffith Memorial Prize for 1925, is being presented at last in the following pages to the reading public. I must humbly mention that this thesis is rather a result of certain specific inquiries, undertaken by me in 1923, to satisfy a curiosity as to what wealth of information on the subject of Plants and Plant-life might yet be gathered from Indian literature which is a continuous record of many centuries and a vast store-house of human experiences, fancies and speculations. It was not an easy task for me to face the difficulties of exploiting the various sources of information, specially where these remained concealed in Sanskrit and other Indian works not accessible to me in English translations. It is happy to recall to my mind that when I had proceeded with the task the prospect was far from being bright, but to my great astonishment within a month I was while to collect numerous passages having bearings

upon the subject, and enabling me to conceive a much wider plan of treatment than one restricted to the requirements of the Science of Botany. This is to say, that in this thesis the plan has

only been partially carried out. I have little doubt that a vivid account of how much human civilisation has derived from Plants and Plant-life in its progress, on the basis of the materials collected by me, will read like a

romance which may be calculated not only to

fascinate but also to instruct.

The plan and method of treatment which I have followed in working out the present thesis are intended to meet the demands of a modern student of Botany like myself. The masses of information collected by me have been classified and systematically arranged for the convenience of reference. It will be seen that the chapter-

and systematically arranged for the convenience of reference. It will be seen that the chapter-headings are taken from Botanical treatises, and expedience is my only excuse, for, in the absence of any Indian Botanical text there is no other alternative than utilizing a scheme which is available, in order to render the treatment of the subject really systematic. But I think I have not failed to indicate the three different lines upon which the contemplations of the Ancients on Plants and Plant-life had proceeded in India. As a matter of fact the titles of the three Books

Book I Botany and Philosophic Speculations
Book II Botany and Science of Medicin

Book III Botany and Science of Agriculture

have been conceived on the basis of three different lines that I was able to make out.

In the Introduction I have tried to suggest what reply can reasonably be given to the enquiry whether there was at all anything like a Science of Botany in India. It has been suggested that there are not only reference to such individual Sciences as the Krishitantra, Vrikshāyurveda and Bheshajavidyā but clear quotations

from such individual authors as Kāsyapa, Parāśara and Sāraswata. And yet I have not gone so
far as to maintain that there was any single ancient Indian treatise coinciding with any of the
modern treatises of Botany. I have been concerned to emphasise the fact that the ideas of
plants and plant-life in India are traced to a
stage when Botanical discipline had not obtained
an independent position, for much of the know-

ledge which might be relegated to the Science of Botany appears to have been either subservient to Philosophy, or to the Science of Medicine, or to the Science of Agriculture.

In each Book, and in each of its sections I have dealt with a particular topic, and the information supplied in different heads will, I hope, sufficiently show that though much of the knowledge is common place, there is abundance

of scientific observations classifications generalisations, theories and applications While I

selves, I must say that in my opinion the supreme value of such a study as mine is rather historical. When I say this I think I have said much. An acquaintance with the accumulated

experiences of those who have gone before us, and attempts to grapple with the problems

leave the following pages to speak for them-

suggested by the phenomena which confronted them, is sure to serve as an inspiration and strengthen us in our belief that the patient investigations which the modern students are carrying out in the field of Botany are of paramount importance for the progress of human knowledge and increase of human

human knowledge and increase of human comforts.

Among the works consulted I must acknowledge my immense debt to Dr. B. N Seal's "The Positive Science of the Ancient Hindus." I have freely utilised the translations of the Vedic hymns, the Charaka and Suśruta-samhitās, and

other original texts rendered by authors whose names have been mentioned at proper places. I regret that from want of time I have not been able to verify all the Latin synonyms of the plants mentioned in the work, and in some cases the Latin equivalents have not been given at all: This is an omission which I hope to rectify

This is an omission which I hope to rectify should a second edition of the work be called for. I have no pretension to Oriental Scholarship, nor am I a Sanskritist I cannot perhaps claim

that I have been able to give the subject a full

treatment it deserves. I am aware of my shortcomings, but if the account of Plant-life serves to awaken a genuine interest in the study of this subject I shall regard my labour as amply rewarded I am very grateful to Dr. B. M. Barua. D Lit. (London), of the Calcutta University, who gave me his best guidance in formulating the scheme of the work, and I am sure nothing will please him more than the continuation of the present work so as to give completeness to my accounts of Plants and Plant-life as in Indian treatises and traditions. I am also grateful to Mr. R. C. Adhikary, a great lover of ancient civilisation and things Indian, who has never failed to cheer me up with his valued friendship and helped me materially with suggestions and sound criticisms from time to time but for which my work would have been substantially poorer. My thanks are also due to the staff of the Calcutta University Press who have always been patient, courteous and helpful to me-a novice in the matter of publication. I should not conclude this preface without mentioning that my wife has all along associated herself with this humble pursuit of mine, specially in seeing the book through the press and preparing its contents together with the list of the

plants mentioned in the text

As the proofs had to be seen in haste, and that by a hand not at all expert in the business, many ugly errors have crept in, and for these I offer my sincere apologies.

Botanical Laboratory,

Presidency College,

Calcutta.

CONTENTS

Introduction

PAGE

Was there a Science of Botany in Ancient India, the term Virkshāyurveda in Agnipurāṇa and Brihatsamhitā, and Gulma-Virkshāyurveda in Arthasāstra; the object of the three authors in using these terms; the interdependence of the Ancient Botanical Science and the Ancient Art of Agriculture; the term Krishitantra—its meaning, Krishi-Parāśara—a treatise on Agriculture; Ancient Botanical Science and the Ancient Indian Science of Medicine; Rig-veda, Atharvaveda and Charaka; the use of the significant term Bheshajuvidyā in Dhanvantarī Nighantu; the division of the thesis into 3 Books

1-10

Book I

BOTANY AND PHILOSOPHIC SPECULATIONS

SEC. I—GENERAL OBSERVATIONS

Subject-matter dealt with in this Book .. 15-14

SEC II-GERMINATION

Its Sanskrit equivalent; its conditions; seedling; its Sanskrit equivalent; stages of germination

15-I7

PAGE

SEC. 111-EXTERNAL MORPHOLOGY

General description of plants; as in Rigveda, Vrihadāranyaka Upanishad and Vishnupurāna, Root and Shoot; Root; different kinds of roots; Shoot; general consideration; Stem; its description; Leaf; simple and compound leaf; Flowers; Inflorescence; Fruits; their classification; Seed; Endosperm; Cotyledons—with Sanskrit equivalents in all cases

18-26

SEC. IV-INTERNAL MORPHOLOGY

Twach (skin); Śahuro (soft tissue next to skin); Kināta (fibres in Sakara); Dāru or Sāra (wood), Majjā (pith); healing up of wounds

27-29

SEC. V-PLANT PHYSIOLOGY

Nourishment—general; Absorption; Transport; Transpiration; Assimilation of food: Planting; essential preliminaries of plantation; methods; graftings; cuttings; final directions of planting; Manuring; Rotation of crops; Treatment of plants, general; signs of the diseased condition, Treatment-prophylactic; curative, application of drugs; Respiration; Movement of plants; their capacity for sleep; their sensitiveness to touch, heat, wind, noise, etc., movements towards favourable and avoiding what is unfavourable; Growth; its stages; the conditions to be satisfied, Age and death; Consciousness in plants: different views held by different authors; existence of the gift of touch gift of hearing sight power of sense and organ of taste in plants as discussed

in the Mahābharata; Sexuanty; Reproduction; six methods of reproduction—Vijarāha, mālaja, skandhaja, graftings, parņayoni and Saunarudhaja

SEC. VI-Ecology

Division of lands into three regions—Jāngala (diy wilderness), Anāpa (watery, swampy) and Sādhārana (ordinary) Jāngala—its topography; its characteristic flora; Sādhārana—its topography, its characteristic flora; Sādhārana—its topography, its characteristic flora, Alpine flora; Plant Association; illustrations

SEC. VII-TAXONOMY

Nomenclature: Sir W. Jones' observation on Indian method of naming, Principles adopted in naming; Special association; Special property—medicinal; Special property—domestic utility; Special characteristic features; Special morphological features—according to the number of leaflets in the compound leaf; according to the nature or shape of the leaf; according to the shape and colour of flowers; miscellaneous; Local association; Environmental association; Other characteristics; Double names for each plant—one based on a salient external feature, the other on some prominent medicinal or other property...

2. Classification: three distinct systems—Botanical, Medicinal and Dietic; A. Classification on Botanical Principles—general; different authors—Rigveda, Manu, Charaka, Chakrapāni, Suśruta, Dalvana P tapāda, Śridhara Udayanacharyya,

30-65

PAG

66-70

71-78

17			
м	4	a	P

Bhāgavatapurāṇa, Amara, Further classification of plants into well defined groups or generu (?): into individual plants or species (?)

79-82

- B. Classification based on Medicinal properties: according to Charaka; his 10 primary

 Vargas; according to Susruta; his 37 ganas . 90-104
- C. Classification based on Dietic value. Charaka's division into 6 groups all bearded grains, all pulses, vegetables, finits, greens, sugarcane and oil; Suśruta's division into 15 groups; Amara's illustrations of the $S\bar{a}ka$ Varga; Bhābaprakās combines medicinal properties and dietic value and classifies plants into 10 Vargas. 106-127

SEC. VIII—PLANTS AND EVOLUTION

Ideas of different authors—Uddālaka, Varuņa;
Yājñavalkya; Buddha—distinct mention by Buddha
of the evolution of plants in themselves from the
low to the higher grade; Rāmāyaṇa—prior
appearance of plants on earth 128-130

SEC IX—MISCELLANEOUS APPLICATIONS OF THE SCIENCE

- (1) As a means of Economic Predictions—inference of the cheapness of various commodities by Icoking at the abundance of the growth and development of flowers, etc.; Signs of coming rains 131-134
- (2) As a means of ascertaining the presence of water in a dreary region; Jātaka story ... 135-139

PAG

APPENDIX A-HEREDITY

Transmission of specific characters; Charaka's enquiry; Charaka and Suśruta's theory of 'palingenesis', Charaka's theory—its comparison with Darwin's 'gemmules' and Spencer's 'ids'; Sańkara's explanation; Acquired characters, their inheritance, Charaka's solution after Âtreya; the parental Vīja is an organic whole independent of the developed parental body and its organs (cf. Wiesmann's 'geimplasm' theory); Âtreya's 'germplasm' theory; transmission of acquired

Book II

characters—Atreya's explanation 141-146

BOTANY AND SCIENCE OF MEDICINE

SEC. I—GENERAL OBSERVATIONS

140

SEC II-BEGINNINGS OF MEDICAL SCIENCE

Genesis in Rigveda, names of certain plants with Soma at their head, innumerable applications of plants are referred to though not definitely named 150-157

SEC. III-DEVELOPMENT IN ATHARVAVEDA

Maladies, their classification and remedies—(1) *Physical maladies* such as leprosy, fever obstruction of urine head diseases evil of the

mjury and diseases in and general; (2) Supernatural maladies, such a-, influence of demons, Yakshas, ghosts, curse of gods, etc., (3) Procreation and Protection of children such as, to produce the conception of male offspring, against abortion, to guard against a pregnant woman from demons, etc; (4) Curing wounds, etc.-such as, serious wounds, bruise, burns, etc.; (5) Poisoning-against venom of snakes and other maseets, a distinct class of people treating patients suffering from snakebites, the Kuātas, the germ of snake worship; (6) Prosperity and Prolongation of life with plants-treatment of man not only in a state of disease but also in a state of health. (7) Virility and Erotic success-problem of virility and amatory success ... 158-175

SEC. IV.—MISCELLANEOUS USES OF PLANTS IN ATHARYA VEDA

Utility of plants in the growth of hair; atomement of hereditary sins; warding off foes; attainment of prosperity, for a variety of material blessings, etc.

SEC. V.—DEVELOPMENT OF MEDICAL SCIENCE IN CHARAKA AND SUSBUTA

Genesis of the Âyurveda or the Science of Life, division of the Science into six departments, their correspondence with the classification in the Atharvaveda later development 180 184

PAGE

Book III

BOTANY AND SCIENCE OF AGRICULTURE

SEC. I-GENERAL OBSERVATIONS

The three eternal factors in agriculture .. 186

SEC II—BEGINNINGS OF AGRICULTURAL SCIENCE

Rigveda—Agriculture, a dignified occupation; distribution of land by measurement, hospitality a holy duty religiously upheld; Atharvaveda—For successful agriculture, for abundance of grain, the idea of village construction with the "village common", five races of men, for good rain; against animal enemies of corn, Barley, once the staple food; for protection of cattle, praise of kine 187-197

SEC. III—DEVELOPMENT DURING MAURYA PERIOD

Arthaśāstra—Agriculture, an important department of State; Superintendent of Agriculture, his assistants; their qualifications, the function of the Superintendent; Megasthenes—condition of India at his time; his fragments of Indika; observations of other foreigners like Strabo; Aśoka—his Ediets, Manu—promulgation of law protecting agricultural interest; the Varsyas ... 198-206

SEC. IV-Krishi-Parasara

A treatise on Agriculture its subject-matter 207 209

CONTENTS

PAGE

SEC. V-KHANA'S MAXIMS

(1) General maxims governing the conduct of the cultivators; (2) Meteorological observations with a view to the guidance of farmers; (3) Selection of the Soil, (4) Ploughing; (5) Sowing and Planting; (6) Reaping ... 210-216

SEC. VI-AMARAKOSHA ON AGRICULTURE

The Agricultural class; Classification of soils based on fertility, Agricultural implements . 217-219

PLANTS AND PLANT-LIFE

INTRODUCTION

WAS THERE A SCIENCE OF BOTANY?

Botany is a modern science which imposes its own peculiar form of discipline. The subject matter of investigation which comes within its scope falls also within the broader scope of the Science called Biology But Biology, too, as we know it, is a science of modern origin. The pride of this modern achievement cannot be relished by a people like the Indian conscious of a great historic past. At the same time it will be too much of arrogance and self-sufficiency on the part of the advocates of modern sciences to neglect the whole body of ancient treatises and the whole mass of traditions of a great people by treating them as a tissue of credulity and superstition. In the life of the science of Botany, exactly is in the life of other

its possibility. This may be accepted as a truism. Our enquiry then is—was there anything in India approaching the science of Botany? Were there any earlier processes which enabled the people of this great country to gain in the knowledge of plants and plant-life, and the art of application of this knowledge for the improvement of the general conditions of life?

In Varāhamihira's Brihatsamhitā as well as in the Agnipurāna², there is a distinct section dealing with the topics of Vrikshdyurveda—a term which may be literally rendered "the knowledge of tree-life" The very same term with the additional Gulma preceding it (Gulma-Vrikshåyurveda) occurs in the Kautilya Arthusustra in the section's enumerating the functions of the officer in charge of Agriculture, and his assistants. Whether the term has additional word gulma (bushes-shrubs and herbs) or not, the meaning is the same, the word 'tree' where it occurs alone standing for the whole of plant-life in the kingdom of plants; even in the Vedic hymns the term Vanam, Vriksha, being used almost as synonyms.4 Of

³ Chap XXIV, p 115 (Sanskrit original) Bygveda, X 81 4

INTRODUCTION

the three works in which this significant term i. used and a complete section has been devoted to the subject, the first, the Agnipurana, is nothing but a popular encyclopaedia of all kinds of knowledge and practices; the second, the B ihatsamhitā, is a manual containing directions for the applications of the knowledge of astronomy and astrology in practice; the third, the Arthasūstra, is also a handbook discussing matters relating to royal polity and the art of government. Thus all of them are non-Botanical treatises; all are intended not so much to acquaint the students with theories as with practices. In each of the three works we come across a section1 dealing with the subjects of Vriksháyurveda. The matters dealt with in these sections are of the same character. All of these agree in giving us the impression that the subjects within the scope of the ancient science ot plant-life consisted of collection and selection of seeds, germination, grafting, cutting, sowing, planting and nursing, selection of soil, manuring and cultivation of soil under favourable meteorological conditions, and the location of plants for improving the aesthetic and hygienic surroundings of the homestead. There are certain points of difference which are of paramount importance in the absence of any

ancient Indian treatises or manuals of Vrikshā guriedu coming down to us. The section of the Arthašāsira leaves out of account the central point doing justice to the title of the ancient science Vrikshāyurveda, namely, the treatment of plant-diseases and prescriptions for remedies.' This point comes out prominently in the Brihatsańhitā and the Agnipurāna. On the other hand, the section of the Arthašāstra is not without a special importance not only for its antiquity but also for a clear statement in which the ancient science of plant-life appears to be treated as a sub-head of Krishitantra, a term obviously signifying a treatise on Agriculture The statement is quoted below.

"मौताऽध्यत्तः लितन्त्रगुलावत्तायुर्वेदत्तस्त ज्झसको वा सर्वेधान्य पृष्य फलगाक्त कन्द्रमूलपाक्षीकाकीसकार्या मर्वी जानि यथाकालं ग्रह्मीयात्॥"

By this the officer in charge of Agriculture and his assistants are supposed to be conversant with the treatise of Agriculture (Krishitantra) and knowledge of the life of Bushes and Trees, and well trained in the art of utilisation of their knowledge. Dr. Shama Shastri in his translation has represented Krishitantra as a science of scientific treatise dealing with Gulma-Vrikshā-yurveda and he cannot but do so in regard to

Fo English Trans ation—see Shama Shaatri Chap XXIV p 188

But from the construction of the sentence it is clear that Krishitantra and the Guima-Frikshå-yurved r are two separate terms used to denote the two departments of knowledge. If in a

particular context one has been treated as a subsection of the other, necessarily, the implication is not that the departments of knowledge signified

the matters dea t with in this part cular sect on

by them were not independent; the point which is clear from the Arthasāstra is the interdependence of the two. A treatise of Agriculture will be incomplete without a chapter dealing with the application of Botanical knowledge to the art of plantation, cultivation, manuring and the rest. In the other two references the term Vrikshāyurveda looms large and the Krishitanira does not find any mention. But here, too, the purpose is just to show the application of the knowledge relating to ancient science of plantlife for agricultural, horticultural, irrigational and economic purposes.

The question is—did the authors of the three treatises really intend cataloguing some useful prescriptions for utilisation of this knowledge to exhaust the contents of the science contemplated by the term Vriksháyurveda? The answer must be in the negative. If the sections in the three non-Botanical treatises mean anything, a must be that there was in existence an

independent treatise or treatises upon which the

prescriptions contained in them were based They may be taken also to mean, no doubt, that the Ancient Botanical Science was developing at first along with the Art of Agriculture before it gained an independent foothold of its own

Are we to suppose that the knowledge of plant-life developed along with the Science of Agriculture alone? First, let us enquire if there were any separate treatises devoted to the two sciences, one relating to agriculture, and the other to the knowledge of plant-life. Varaha mihira's commentator—Bhattopāla—in explaining the prescriptions in the section on Frikshayurveda, has elucidated the points by certain quotations from three ancient authors, namely, Kāśyapa, Parāśara and Sārasvata. It seems probable that the treatises ascribed to these authors were primarily concerned with Krishithe art of cultivation, Krishz-Parāšara being the traditional title of a treatise associated with one of these authors There is no reference as yet found out where Krishitantra and Vrikshayurveda have been exchanged one for the other. If it stands out from the sections in the Brihatsamhıtā and Agnipurāna that the treatment of plant-diseases and their remedies was one of the subjects of investigation falling within the scope of the Botanical science, it may be supposed to have formed, so far as this point is concerned, also a subhead for the ancient Indian science of

INTRODUCTION

Medicine So far as the recorded evidence goes

the reference indicating the close association of the knowledge of plants and plant-life with the art of healing are much earlier and plentiful. We shall briefly examine below two Vedic hymns one in the Rigveda and the other in the Atharva Veda, and see what light they throw on this point.

In the hymn of the Rigveda¹ the poet speaks

of 107 applications of plants to make people free from diseases, the plants bearing flowers and fruits, etc. There is not a single utterance in the whole hymn referring to applications of the knowledge of plants for agricultural and other purposes.

In the hymn of the Atharva Veda² the different herbs and plants are named, classified and praised only for their medicinal properties. There is not a word about the connection of the knowledge of plants with agriculture, irrigation, and the rest. And this is just the typical of several other hymns that corroborate the point.

The popular Indian word ausadha denoting medicine is derived from or connected with Osadhi signifying the annual herbs. Even at the present day, in some parts of India, the word $d\bar{a}ru$ or tree is used to denote medicine, and in

¹ Rigveda, X, 97.

Atharya Veda, VIII, 7 (pp 498-500 Wh tney)

PLANTS AND PLANTILE'S

the Soma. The moon bears the designation of Oşadhmātha—the lord of herb, here Oṣadhi being a synonym of 'Soma' which, according to the above hymns of the Vedas, was the king of the herbs and plants. The word bheshaja from which bhishak denoting physician is derived, etymologically means "vegetable drugs"

In an expressed opinion in the Charaka-samhitā¹ it is only the man well acquainted with the names, and external features of plants, and able to use them properly according to their properties is to be called an expert physician.

The Dhanvantari Nighantu' which is more explicit on this point says,—"Sometimes several

Cf Preface to the Raja Nighanto of Normhuri where he says -

नानानियौषिध रसाम्वय वौर्यपाक प्रत्येक सम्बर्गवबीषक्रत यमीपि सुच्चत्ववश्यमनवैच निवन्द्रभेतम् सम्माद्य विरचितौ भिषजा विताय ।

Also Rasaratnasamuchchaya—Ohap VII. 32 "Such herbahats as are not dece that and are well versed in the kin wedge of the drugs

healing vegetables (bheshajus) bear one name, sometimes one vegetable bears various names according to its class, external feature, colour, potency, function (rasa), effects, properties and the rest."

"The physician does well to master Bheshaja. $Vidy\bar{a}$ by acquainting himself with the various names of plants in Sanskrit and Prakrit, consulting all classes of men, by personal observations, by a careful handling, as well as, by a careful consideration of its specific characters and sexuality."

In this quotation we find the use of a technical term Bheshaja- $Vidy\bar{a}$ signifying a distinct study of the plants and plant-life with special reference to medical properties and use.

Here, too, the same question is apt to arise, does this study complete the contents of the ancient Botanical science? We must say, No. Throughout Indian literature we find the theories about the evolution of plants, about the

and plants, and in the language of many countries should be employed." (P C Boy's History of Eindu Chemistry, Vol I, p 65 Calcutta, 1902.) Also the final test to which Bhikshu Atreya the celebrated teacher of medicine in the University of Taxila, put his equally celebrated pupil Jivaka, afterwards the physician of Bimbisara, in collecting, identifying and describing the properties of plants to be found within four Yojanas of the University town (Vijayratsa Sen—Preface to Viraja Charan Sen Gupta's Vananshadhi-

Darpana, Vol I 1908)

nature of plant life, the position of plants in the whole scheme of nature and the like, developed along with the various philosophical speculations.

Even for a brief survey of the entire field of Indian Botanical Science we must trace its developments in these three different lines:

- (1) As under the Philosophic Speculations.
- (2) As under the Science of Medicine.
- (3) As under the Science of Agriculture.

Accordingly the thesis is divided into three books bearing the following titles:

Book I.—Botany and Philosophic Speculations.

Book III.—Botany and Science of Medicine. Book III.—Botany and Science of Agriculture.

Воок І

BOTANY AND PHILOSOPHIC SPECULATIONS

SECTION I

GENERAL OBSERVATIONS

The daring philosophic speculations and fanciful popular notions are always in advance of science. The hymns of the Vedas, the texts of the Upanishads, the Epics and Purāṇas, the Buddhist and Jaina canonical works and commentaries, the medical treatises of Charaka and Suśruta, the lexicon of Amara and such other works yield us plenty of materials indicating how the knowledge of plants and plant-life came into clear recognition, and the Botanical science developed on various lines The information culled from these sources can be considered under the following heads:

- I. Germination of seeds.
- II. Morphology—External, i.e., general description of Plants
- III. Morphology—Internal or Histology.
- IV. Physiology.
 - 1. Nourishment.
 - 2. Absorption, Transport, Transpiration and Assimilation of food.
 - 3. Planting.
 - 4 Manuring

- 14
- 5 Treatment of Plants
- 6. Respiration (Breathing).
- 7. Movement—Irritability
- S. Growth.
- 9. Age and Death.
- 10 Consciousness in Plants.
- 11. Sexuality.
- 12. Reproduction.
- 13. Heredity. (Appendix A.)
- V. Ecology—Study of Plants in their natural surroundings (homes).

VI. Taxonomy.

- Nomenclature or the naming of Plants.
- 2 Classification or the grouping of Plants based on—
 - (a) Botanical principles.
 - (b) Medicinal properties.
 - (c) Dietic value.

VII. Plants and Evolution.

VIII. Miscellaneous application of the Study of the Science of Plant-life—

- 1. As a means of Economic predictions.
- As a means of ascertaining the presence of water in a dreary region

SLCTION II

GERMINATION

The process of germination is technically called anh urôdbheda, a term which means sprouting, i.e., the awakening of life latent in the seed under certain given conditions. And

the conditions are-supply of air, water and

ऋतु चेत्रास्व्वीजानां सामग्रादङ्शे यथा—

warmth. We read in the Suśruta¹:

"Just as the proper season (ritu), good soil

(kshetra), water (ambu), and vigorous seeds (vi/a), together with proper care, help the remination of strong and undiseased sprouts "2"

Again in Guṇaratna's Commentary on the Ṣaddarsana-samuchchaya:

वटिपप्पलिम्बादीना प्राष्ट्रजलघरनिनादिग्रिग्रिरवायु-सस्पर्गादङ्क्रोद्वेद:॥

"The seeds of Vata (Ficus Indica), Pippala (Ficus Religiosa), Nimva (Melia azadirachta) and

I Sufruta, Šārīrasthāna 11, 83

Vol. II p 129 Nuglish Translation by Kunjalal Visagraina
 911

the rest, sprout during the rainy season under the influence of dew and air (when sown)."1

16

The following aphorisms of Khanā also contain the following direction of aerating the soil for different plants:

PLANTS AND PLANT LIFE

soil for different plants:

"For the successful cultivation of cotton one has to plough the land 16 times, for radish 8 times, for paddy 4 times and for betel nil."

The soundness of the directions becomes at

once manifest when one takes into consideration that cotton plant has an elaborate root-system, radish is a herb, paddy is a surface feeder, and betel is a climber that produces numerous adventitious aerial roots.

From the above we see that the factors of air, water and warmth (proper season) are regarded as necessary for successful germination of seeds.

The seedling is called ankura, avinavodvid, which etymologically means that the plant becomes visible for the first time by it. Scientifically this term is more accurate than its

English synonym "seedling".

Although the ancients laid down the conditions of germination arrived at by practical experience, they have not, so far as our knowledge.

tions of germination arrived at by practical experience, they have not, so far as our knowledge

Gunaratna's Commentary, Sloka 49, p 157 Saddarsana samuchchaya, Bibliotheca Indica, new series 1151, 1907

° বোল চাবে তুলা তার অর্থেক মূলা ° তার অর্থেক বান বিবা চাবে পান ∎ goes, cared to state the stages of germination as is done in the modern treatises on the subject. Yet the Sanskrit word uttānapāda taken from the vegetable world is significant. During germination it is the Radiele (māla, pāda), the primary root, that comes out first, even in whatever position the seed is placed. The words uttānapāda, ūrddhvamūla mean "the root foremost." Thus it is not inconceivable that they did not fail to notice the first stage in germination.

SECTION III

THE GENERAL DESCRIPTION OF PLANTS

The rudiments of morphology may be traced as early as in a hymn of the Atharva Veda¹ where we get a rough description of the external features of plants.

"The spreading, the bushy, the one-spathed, the extending herbs do I address, those rich in shoots, jointed, that have spreading branches: I call for thee the plants that belong to all the gods, formidable, giving life to men." (1.)

"Rich in sweets the root, rich in sweets the tip of them, rich in sweets was the middle of the plants, rich in sweets the leaf, rich in sweets the flowers of them, etc." (12.)

"Rich in flowers, rich in shoots, rich in fruits, also those lacking fruits—like joint mothers, etc." (27.)

A more systematic statement in brief occurs in the Vrihat Âranyaka Upanishad² where we get an accurate description of the life history of a plant. Thus

" * the essence of water is embodied in plants such as grasses, creepers and the rest, flowers represent the essence of plants, and the

Asharva Yeda VIII, 7 Whitney Ed. V A Upanishad 4.6 I

essence of flowers are fruits, such as paddy, wheat and the rest."

We again read in the Fishinipurāna a description of the parts of a complete plant. The type given is that of paddy. Thus:

"O the greatest of sages, just as there are embryo (ankur), root (mūla), stem (nāla), leaf (patra), flower (pushpa), milky sap (leshira), husks (glumes—tūsha), seed-vessel (lesha, vija kosha), seed (landula, rice) and endosperm in seeds (kanā) in the paddy, and they become manifest only under suitable conditions such as soil, water, etc."

The quoted passages contain terms and expressions covering the whole of the external feature of plants which we now call External Morphology. The points that are to be noted, according to these passages, comprise root, stem, leaf, flower, fruit, seed, etc.

All plants are divided broadly into two parts:—A subterranean called the Root ($M\bar{u}la$, $P\bar{u}da$), and a sub-aerial called the Shoot ($Vist\bar{u}ro$). Let us now consider what the Ancient Botanical Science has got to teach us on all these points taken one by one.

. 1. Root.—The Sanskrit equivalent of this organ is significantly expressive at once of its function and location. It is called $m\bar{n}la$, i.e., by its means the plant is fixed to the soil. The

¹ 7-h Chapter 6 okus 8º-89 Bangabäsı Fdition р ¹2¹

plant is called pādapa, i.e., by its pādas (mūlas), the plant drinks (absorbs) water (rasa—watery solution) from the soil. Adventitious roots are called śāhhā śiphā (fibrous roots springing from the branches). Fibrous roots are called—siphā, jatā. Adventitious roots hanging from spreading branches (prop roots of Ficus indica, also of Tinospora cordifolia) are called abarôha, i.e., that which goes down, hangs. We also learn from Arthaśāstra,¹ Charaka, Upanishads, etc., that people used to take it as food and in this connection we find mention of 'bulbous roots' as distinguished from typical ones.

2. Shoot.—The shoot is divided into stem and leaves. The main stem (trunk) is called prakānda, i e, it is that part which is between the main root and the place from which branches originate. It is also called shandha as it bears the head or crown The stem may be weak or strong and so are the plants having them. Strong stemmed plants are called vanaspati, vānaspatya, etc., they stand erect. The weak stemmed plants cannot support themselves, and according to their habit they are distinguished into-a creeper and a trailer. A creeper is called valli, vratatī, or latā. The creeper includes both a twiner and a climber. Lata means that which embraces, twines. It also means a weak plant that goes from the root to

¹ Arthasāsma, Section 24 p. 138. Shama Shasim's Edition, 1932

the top of a tree (mulachchagra jatan latu) By the term latā is meant the whole range of lianes. (वज्ञी वेष्टयते हर्च-Śānti Parva).

The other kind (trailer) is called *protānino*, spreading one,—that which spreads on the ground. This includes both the procumbent and the decumbent.

3 Stem —The stem may be plain or jointed.

3. Stem —The stem may be plain or jointed (śatu parva). Each joint or node is called a parva or granthi. Leaves spring from the joint (स्तम्बे गुल्मे ट्याहीनां काण्डद्रमगुच्छयो:). Plants may be with stems or stemless. Stemmed plants are called sahānda, and stemless plants

are distinguished as aprakāṇda, stamba. Plants having short or stunted roots and branches are called kshupa (चुप:—इस्याखा शिफ:). The primary branches are called shandaśākhā, and secondary and tertiary ones are known as praśākhā (प्रशासा:), pratiśōkhā and anuśōkhā (प्रतिशासा: and अनुशासा:) are also used. The branches generally

are known as $\delta \ddot{a}kh\bar{a}$, as the plant $(\delta \bar{a}khina)$ spreads by them. Branchless stems are called

sthanu or sanku. Apex of the tree, i.e., the tree-top is called fixed, agra, sukhara, i.e., where one cannot climb, or which cannot be reached.

Trees, shrubs and herbs used to be distinguished by the long or short, hard and strong

¹ Vishnupurāna, 3rd part, 4th Chap, Sloka 25

or less stron, and succulent stems. Plants growing on other plants (बचीपरि बची) are known as paryāchhā (परमाञ्चा इति स्थाते). These include both Parasites and Epiphytes. Parasites are called erikshādanī (cascuta-इचादनी हचमति यु:), that which (guest) eats (sea-sucks food from) another tree (host). Epiphytes are called vriksha-rম $har{a}$ (**হলবস্থা**—হল বীস্থানি হনি), i.e , thatwhich simply lives on another tree without drawing nourishment from the latter. One of the examples given is Guduchi (Tinospora cordifolia)—it is called chhmnarāhā (ভিৰভা-ভিলাবি राहित जायते वा:)—"it grows and lives even when torn." Another example Vanda Roxburghii Br., ie, Orchid (Rasna) is known (Colebrook), but its habitat is not described. (See infra, classification) Lower plants such as Mosses and green Algae are noticed but not described (such as जलनीजी तु ग्रैवालंम्-Amara). Saprophytic plants, such as Mush-rooms (plants with no fruits and flowers), are correctly described with their habitats, but not separately classified. Mush-room is thus described :-it is called Chhairā (表面) 1 as its shape is exactly like that of an umbrella. "It is generally found to grow on stalks of straw (pulāla), or is seen vegetating on the stems of bamboo (venu) or sugarcane, or as sprouting up from beneath the surface

GENERAL DESCRIPTION OF PLANTS 23

Underground stems and such roots as Radish (hypocotyl modified) are called *kanda*. These are described as 'like roots, but not roots,

of the ground (udbhida) or growing on a heap

of decomposed cowdung (harisha)."1

serve as a means of propagation' (यस्त्रमेव वीजं स कल्टा). As examples are mentioned:

Ol (Corm), 6 kinds of Potato (Tuber', Mūlaha (Radish), Gājar (Carrot), Plantam (Rhizome), Mānkachu (Arum-Rhizome), Palāndu (Onion-Bulb) and Mahā kanda (Garlie).

4. Leaf:—The leaf is called patra, because it falls soon, it is also called parņa because of its green colour. The stalk of the leaf when present is called brinta, and the petiolate leaf is called sa-brinta New leaves are called pallava, hishalaya. Branches with undeveloped leaves (pallava) are called vistāro as the plant

spreads by it. It is synonymous with modern 'bud.' Leaves may be simple when it is called eha-patra—one-leaved. Compound leaves are

described by the number of leaflets they contain, e.g., drv-patra (Bauhinia?), trv-patra (Egle), sapta-parna (Echites scholaris). Leaves are also described by their shapes such as aśwa-parnaka (Shorea robusta)—as the leaves resemble the ear of a horse; mushika-parni (salvinia)—as the leaves resemble the ear of a mice

Itsaparní (Achyranthes aspera) monkey ear shaped leaves, and so on.

5. Flower:—The flower is called sumanosa—that which pleases mind, it is called pushpa because it opens; it is called prasūna because it is born (from plants). Unopened flower bud is called kalikā, koraka, i.e., that which produces (fruits, etc.). Opening flower bud is called kutmala, mukula. Full blown flowers are called vikacha, sphutāh (विकसितं सितं).

Bunch of flowers, ie., Inflorescence, is called stabaka, guchchhaka.

A compound pedicel is called vallari, manjari; Helicoid cyme is called śrihastini (resembling the trunk of an elephant). The inflorscence of umbelliferous plants is called chhatrā. ऋताकार स्तवक: is umbel. Flower stalks (pedicels) are called prasava-bandhana, i.e., that which binds flowers and fruits with the mother plant. Shape of the flowers in some cases is also noticed, ey, papilionaceous flowers are called valira pushpa (Sesbania). Petals are called pushpadala, and sometimes number of petals are counted such as śatadala, sahasradala. Stamens are known as kešara; kuñjalka is the hairy part (स्ववत् श्रंश) within flowers; pollen grains are called kesurarenu (stamen dusts), they are also called paraga (पराग), as they go fast (परा) being very light and carried by air They are also called

CENTRAL DISCRIPTION OF PLANTS 25
समनोरनस्—dust in flowers Lar or spike of a

6. Fruit:—The fruit is known as phala,

corn is called kinasham, sasyamanjari.

i.e., the result of a previous process. Green fruits are called salātu, dry fruits are called vāna, and fleshy fruits, such as gourd and the like, are called kshāraka, jālaka. A legume or pod is called samī, simba, and the seeds in it samī dhānya.¹

Classification of fruits:—Was not based on any scientific principle. Their classification was rather governed by etymological consideration.

i.e, names used to be given in allusion to trees, their origin etc., e.g.,

Amra (সভা) or mango, fruit of mango tree.

Jambu (জ্ঞু) or black-berry, fruit of Eugenia jambolana.

Aingud (উদ্ভূহ), fruit of Ingudi (Balanites Roxburghii).

Plāksha (খ্লাছা), fruit of Plaksha (Ficus

ınfectoria).

Vannaba (ইতাৰ), fruit of Tenu (Bamboo).

Vārhata (বাছন), fruit of Vrihati (Solanam indicum).

· Nanyagrodh t (नैययोध), fruit of Banyan, and so on.

7. Seed:—The seed is called vijam (वीजम्), that out of w ucl something grows Sceds are

enclosed in a vessel called *vijakosha* or seed-vessel. Seed-vessels are sometimes identified with integuments (seed coats) and sometimes with pericarp (ovarian wall). The kernel is called *ŝasya* (endosperm) and the cotyledon is called *vijapatram* (वीजपतम्).

3

SECTION IV

MORPHOLOGY-INTERNAL OR HISTOLOGY

The Ancients broadly differentiated the stem into two parts—an outer called the trach, valkala (rind, skin); and an inner the wood or essence—the sāra (सार), i.e., that which lasts till the end of time (कालान्तरमिति) enclosing the majjā (the pith). The outer part included the modern bast and the inner part the wood with pith as usual. Thus the stem is internally differentiated into—

- (a) an outer rind,
- (b) the wood on which the softer parts are fixed, and
- (c) the pith enclosed within the wood as marrow by the bone.

A more elaborate attempt is seen in the Vrihat Āraṇyaka Upanishad, where the inner structure of plants is described after the analogy of the human anatomy.

Thus:

"The body of the plant is exactly like the body of man; the hairs of man corresponding to the leaves of plants and his skin (西東)

¹ Chap. HI. 9th Brahmana. Lotus Library Edition. pp. 1004-5.

corresponding to the dry exterior bark of the plants" (234-28-1).

"The flesh of the human body answers to the śakura (soft tissue next to skin) of plants: his nerves standing for the kinūta (fibrous tissues in śakara as in jute, ctc) of plants, both being equally strong. Just as the bones of man lie behind his flesh, so also wood, dūru, lies behind the śakara (and occupying the centre) of plants and the marrow (pith) is alike in both" (236-30-3).

Thus the internal structure of plants is evidently divided into an outer skin (epidermis and dry bark) and the inner wood between which stands a softer tissue (bast) with strong fibres (bast fibres) corresponding to human flesh with nerves. The wood encloses a soft pith. This division is not altogether fanciful, as it contains an essential broad truth which has not been made obsolete by the elaborate scientific modern researches.

A curious advance in the knowledge of plant life is displayed in Sankara Miśra's Upāskara where he notes (ছছিল্লন্মন ধাইছেওঁ ব)—the growth of organs (or tissues) by natural recuperation after wound or laceration.¹ Also "the closing up of fracture (in plants) are manifest means of fruition."²

Upāskara on Vaiseshika Philosophy—4.2 5 — the Sacred Book of the Hindus Series, Vol. VI. Panini Office, pp. 159-60

² Of also Gough's Trans. Benares, 1873 pp. 147 148

MORIHOLOGY INTLANAL OR HISTOLOGY

In Gunaratna's commentary also we not a reference of healing up of wounds in plant.

Thus.

"यथा सनुष्यश्रहीरस्त्रीषधप्रयोगादृहिङानिज्ञतसुम् रोहणानि, तथा वनस्रति श्रहीरस्रापि।"

¹ Bibliotheca Indica, New Series, 1151 (1907).

SECTION V

PLANI PHYSIOLOGY

1. Nourishment—General.—Guṇaratna in his commentary on the Ṣaddarsana-samuch-chaya¹ very aptly describes the influence of soil and food upon the vegetable system in producing health and disease:

"तथा, यथा मनुध्यशरोरं स्तनचोरव्यञ्जनोदनाद्याचारा-भ्यग्हारादाचारकम् एवं वनस्पति श्ररोरमपि भूजलाद्या-हाराम्यवहारादाहारकम्। तथा, यथा मनुष्यशरीरमिष्टा निष्टाचारादि प्राप्ता वृद्धिचान्यात्मकं तथा वनस्पति-धरोरमपि।"

"Just as the human body receives sustenance through the assimilation of the mother's milk, dishes, etc., so also the vegetables assimilate food according to the nature of the earth (soil), water, etc."

"Just as the human system is at ease and is diseased according as it takes wholesome or unwholesome food so also plants grow or decay by assimilation of suitable and unsuitable food,"

Thus connected with the nourishment of plants the most important factor is the soil—

¹ Bibliotheca Indica, New Selics, 1151 (1907)

ž

the principal source of sustenance. It is roughly divided into with a (Harman fertile with every crop), and ushara (barren or sterile on which nothing can grow). The fertile soil being that which is capable of supplying the plants with their necessary food materials while the sterile soil is that which does not possess this capacity.

2. Absorption, Transport, Transpiration and Assimilation of food.—Plants draw food materials from the soil through the help of the roots which constitute exactly what is mouth to man, another name for tree being area; ie., that which drinks through roots. It is common knowledge that the food materials from the soil enter plant organism in the shape of liquid and not solid, and the ancient etymology has evidently anticipated the accuracy of the modern scientists.

The elaborate process by which plants absorb, transport and assimilate food is nicely described in the following texts of the Mahābhārata.²

"Just as water may be drawn in through the lotus petiole applied to the mouth, so also plants (with roots) drink (absorb) water (watery solution) with the help of a'r" The comparison is evidently significant. In drawing water through the lotus petiole a force—a sucking force—in the mouth which draws

PLANTS AND PLANTIIEL

in, is pre-supposed, as also uninterrupted passages in the petiole through which the water is to go up. The one end of the petiole is dipped in water and the drawing force is applied to the other. The similie does not stand on all

fours because water stands for the liquid food materials from the soil, the uninterrupted passages stand for similar passages in the stem, but the drawing force is wanting. We clearly see that food materials are drawn up in the case of the plant as water is drawn in the case of the man in whose mouth there is the sucking

case of the plant as water is drawn in the case of the man in whose mouth there is the sucking torce. But we do not see which draws up the food materials in the case of plants? Rationally in the one case as in the other there must be an agent without which the action cannot take place.

take place.

We may safely accept the hypothesis only as a hypothesis, that the knowledge of the existence of the sucking force in the leaves of trees corresponding to the existence of a sucking

trees corresponding to the existence of a sucking force in the mouth of man—a knowledge which is only a very recent discovery, was an accomplished possession with the ancients. The function of air in maintaining the sucking force is distinctly mentioned We now know that

transpiration and hence transpiration force

(suction force in leaves) is greatly accelerated by air.

After the food materials in solution are brought into the leaves the process of assimilation (जोषी) commences, which is thus well-described:

"Agni (energy) and air (CO₂?) help in the digestion (assimilation) of the water (watery food materials) which is absorbed through the roots of the trees (and conveyed to the leaves). And it is on account of the assimilation of this watery solution that the vegetable kingdom undergoes development and becomes graceful."

Thus a thoroughly correct process of digestion and assimilation of food by the plants and the dependence of their healthy development upon the food taken are clearly stated. 'Agni' in the above-quoted passage does not literally mean 'fire' but it stands for 'solar energy' which plays a vitally important part in the sustenance of life, being necessary to all the life processes; and 'air' which the modern researchers have discovered to be the only source of the carbon in the form of CO2, is also indicated as an essential factor in the preparation and digestion of food. As a matter of fact, the Indian thinkers in their own happy-golucky way understood and preserved all the essential knowledge of plant nutrition

A12.5

We have so long hypothetically assumed the existence of the leaf as the centre of sucking force, and practically the kitchen where the food of plants is prepared. What warrants us in the assumption? Besides the full-fledged development of the scientific knowledge of nutrition, we have in some of the provincial proverbs attributed to the mythical Khanā, the depository of the wisdom of ages, a distinct knowledge of the function of leaves in the maintenance of plant-life pre-supposed. A proverb runs

"After you have planted the plantain trees, do not cut off their leaves, and this will bring you both bread and clothes."

Thus when the concatination is fully made out a sustained train of reasoning is seen to be behind this apparently casual proverb.

We quote two other proverbs emphasising the points at issue. One of these runs³:

"Khanā proclaims it to the world that paddy flourishes in the sun and betel under shade."

The meaning evidently is that during rainy season the more there is available solar energy and water the more will be the production and storage of food in the paddy. But, for betel we are concerned only with the leaves and the pungent taste of the latter. We know that the

[&]quot;নাৰিৰে কন্য না ৰ ট' গাঁও তাতেই ৰূপেড় তাতেই জাত * ভেৰে চেৰে বনা বান বোদে ধান ছায়াৰ গান

transferred to a shady place it tends to develor larger leaves. The cause of the pungency is also due to the absence of sun-light, and the reason is that the destructive metabolism cannot reach its final stage and consequently more acid and

other proverb is 1:

FLANT LHYSIOLOGY

shade loving plants have larger leaves and even when a sun-plant with narrow leaves is

"The paddy develops day by day owing to sunshine by day and water by night."

The modern scientific explanation of the fact would be that during day time with the sunshine food is prepared, assimilated and stored and during night time the growth of the organ-

other astringent bye-products are formed. The

ism takes place, and for this a supply of water is needed. The Ancients broadly knew the utility of these two factors, although they by no means seem to be acquainted with the scientific details.

That water besides going up to the leaves also circulates all over the trees, and this circulation is not the same area.

That water besides going up to the leaves also circulates all over the trees, and this circulation is not due to sun's rays, etc., is also noticed by Kanāda in his Vaišeshika Philosophy.' And Sankara Miśra in his Upaskara' has tried more elaborately to answer how water circulates in trees. Thus:

'দিনে বেদি বাত জলা দিন দিন ব∉ড খাদেব বলা।' Kaoāda 5 ° 7 ' **রবা**নিন্দীন ব**ুত্ত কিন্**ন ' S B I Vol VI p 177 (Pa a thice) The circulation (of water) in trees is caused by adrishtam (destiny)

Upāskara commenting on the above aphorism explains:—"Water poured at the roots goes up in all directions through the interior of a tree. Neither impulse, nor impact, nor the sun's rays prevail there. How then is it caused? The action by which waters rise, and cause the growth of the tree results from conjunction of destiny with the souls of those in whose souls pleasure and pain is effected by the growth of the leaves, stem, fruit, flowers etc., as its non-coherent cause; from destiny as its efficient cause, and in water as its co-inherent cause."

That water rises up in trees is also mentioned in the *Bhāgubatapurāṇa*³ as one of the fundamental properties of plants.

3. Planting.—The Science of planting is a very ancient science in India, and the origin of it is lost in obscurity, but a full-fledged development of it is mentioned in the Arthasāstra' where a particular officer is referred to as the

¹ Adushta (he unseen) stands for "unknown cause," or 'unexplained Nature." Scal, page 133. (1915).

2

agriculture dealing with the plantation of bushes and trees, or assisted by those who are trained in such sciences."

A typically nice description is contained in the following verses from Brihat-samhitā!:

"Let us first of all talk of the trees that should be planted in a garden or in the house itself: Arishta (Melia azadirachta)
Ašoka (Saraca indica), Punnāga (Calophylium

inophyllum), Sirişa (Mimosa sirissa) with Priyangu (Aglaia Roxburghiana) should be planted in the garden or in the house as preeminently conducive to the welfare (सङ्ख्यः) of

the house." 3

Kāsyapa adds in addition Champaka (Michalia champaca), Udumbara (Ficus glomerata) and Pārijātaka (Erythrina indica), and they should he planted in "देवालये तथोद्याने ग्रहेषूपवनेषु च।".

The following verses from Agnipurana' give us similar instructions with fuller details:
"It becomes conducive to the welfare of the

house if Plaksha is planted towards the north of it, Banyan in the east, Mango in the south and Aswattha in the west."

"Thorny bushes (क्यूक्स:) towards the

south near the house are also good."

' Vnkshäyn vedäd' yäys, Chap 54, Vo' II p "43

Bibliotheca Indica Vo II 1876 Chap 281 pp 4..., 43

Anshtosoko Punnaja Sirisa Priyaigu Aŝoko, Kaduli (Plantain), Jambu (Blackberry), Vakula (Mimusops) and Dādima (Pomegranate) are to be planted in the garden adjoining one's house"

The following are the essential preliminaries of plantation —

In Brihat-sambitā1 ·

"One should plant the tree after oneself being pure and after worshipping the tree with a bath and anointment, and the result will be that the tree will be graced with luxuriant growth of leaves."

'Uttarā, Rohiņì, Anūrādhā, Chitrā, Mrīgasirā, Revatî, Mūlā, Visākhā, Tishya, Sravanā, Aswinì and the Hastā—these are the stars under the influence of which a tree when planted will flourish.'

In Agnipurana there are verses of similar import. Thus:

"One should take or plant the tree after worshipping the moon and Brahmin, and make sure to propitiate the five stars—Vāyavya, Hastā, Prājesha, Vaishņava and Mūlā."

"One should perform the work (of plantation) after worshipping Varuna, Vishnu and Parjjanya,—the rain God." 6

¹ See Chap 54, Vol. II " **See Supra** p. 37

Next comes the question whether all parts or different parts of a plant are to be planted in different seasons of a year? Varāhamihira in the Brihat-samhitā¹ directs:

"In the months of Mūgh and Fūlyoon (মিমিই) the trees whose branches and leaves are not developed (সুজান্মান্তাৰ্—সুজান অনাজুবাৰ্ হুলাৰ্), in the months of Agrahāyan and Pous (ইমন্ত্র) the plants with just-developed branches (জাল্লান্ত্রাৰ্) in the months of Śrāvan and Bhādra (বর্গামন) plants with well-developed branches (মুক্তব্যাৰ) ." Kāśyapa is more clear on the above directions.

"Plant in Sisira those trees with undeveloped branches, in Henanta those with developed branches according to prescribed rules (বিধানতঃ) and those that are provided with well-developed branches (মুহ্মন্মঃ) during the rains."

Methods of plantations by cuttings and graftings:

In addition to the ordinary method of propagation by seeds the methods of propagation by cuttings and graftings were known from time immemorial, so much so, that the plants to which these methods can be applied are definitely named.

The following verses from Billit samhita distinctly name the plants and these methods.

"Kānthāl (Jack fruit tree), Ašoka, Kadali (plantain), Jambu, Lakoocha, Dādima, Drākshyā, Pālibala, Tijapura (Mātulanga), Atimuktaka—these are the plants to be propagated by means of cuttings besmeared with cowdung (एतं द्रुमा: काण्डरोध्या गोमयेन प्रसेपिता)." 4 & 5

"Better than this method is the method of propagation by graftings. This can be done in two ways—the cuttings of one plant is either inserted on the root of another plant, or on the stem of another plant (मूलोच्हेर्यवास्त्रस्रोपणीया: परं तत:)."

"Grafts should be smeared with cowdung. For transplanting (अन्यदेश नीला रोपयेदिखर्थः) the plants should be smeared from root to the top (आमृज्स्बन्धितानां) with ghee (clarified butter), sesame oil, the honey of the Khudra variety of the bee of the Ushira (Andropogon Langer or Andropogon Citrarum), the Vidanga (Embelica ribes) milk and cowdung"

What should be the soil for such plantation? The same author says:

"The most suitable ground to plant in is soft soil that has been sown with Sesamum

¹ Brihat-samhita, Chap. 54, Vol. II, p. 743.

NB All the Slokes are from the same Chapter—54 of the Bri hat-sambita.

indicum and dug up and trodden with sesame

Kāsyapa is more elaborate on the point:

in flower."

1

 $\mathbf{2}$

"दूर्वाबीरणसंयुकाः सानृपा ऋदुसृत्तिकाः। तत्र वाप्यः श्रभा व्याः सुगन्धिफलणाखिनः॥" The final direction of planting is

According to the same author—
"It is best to plant trees at intervals of 20 cubits, next at 16, and 12 cubits' interval is the minimum that can be prescribed."

12

Aguipuiāṇa has the same thing.

"It is best to plant trees at intervals of 20 cubits, an interval of 16 cubits is next, and worst is the interval of 12 cubits. Closely planted

tiees become fruitless (barren)." 8 & 9

"The trees that are not at first planted after
the Sāstric injunctions are destined to be fruitless."

less."
And why this minimum limit? The answer is given in Sloka 13 of the same chapter of Brihatsamhitā. Thus —"the roots thereby becoming mingled together will interfere with each other's function and will become ill at work, and fruits will not be produced (भिश्वर्मूलीय न फलं सम्बन्ध कि

गोड़िताः)."
After the trees are planted in the manner aforesaid "one should water them in the morning

Agn purana Chap 351 Sokaa 8 9

and evening in summer at the end of the day in winter, and during the rainy season only when the earth is dried."

4 Manuring—The ancients had a pretty sure knowledge of the fact that the plants derive their food materials from the soil, and they had an excellent knowledge of the science of manuring. This is more elaborately dealt with in the Book of Agriculture.

The origin of manuring the soil can be traced as early as to a verse of the Atharva Veda.² The verse runs:

"With the straw of the brown, whitish, jointed barley for thee, with the sesame, stalk of sesame let the, etc., etc."

A more elaborate instruction in manuring is found in the Brihat Samhitā and Agnipurāna, in each of which a whole chapter is devoted to the purpose known as *Vrikshāyurveda*. Thus in Brihat Samhitā:

"To promote inflorescence and fructification, a mixture of one adhaka (64 palas) of sesame, two adhakas (128 palas) of excreta of goats or sheep, one prastha (16 palas) of barley powder, one tula (100 palas) of beef, thrown into one

¹ Srihat Samhitā, Sloka 9, Chap. 54
Agnipurāna, Sloka 7, Chap. 281.
A. V. II. 8 3.
Chap. LIV
Chap. 281

diona (256 palas) of water, and standing over for 7 nights, should be poured round the roots of the plant. The measures given are for one plant." This measure is for all kinds of plants (... वनसर्त:। वज्ञीगुल्यस्तानां च फलपुष्पाय सब्देश).

Agnipurāna has almost precisely the same thing:

"To increase the production of flowers and fruits one should sprinkle ghee with cold milk, also a mixture of sesame, excreta of goats and sheep, barley powder and beef, thrown into water, and standing over for 7 nights should be poured round the roots of the plant" (गोमांसमुद्वाचें समरातं निधापरेत, etc.)

Brihat Samhita:

"To ensure inflorescence, etc. (ज्ञुस्मयुक्तम्व) the seed before being sown should be treated as follows —The seeds should be taken up in the palm greased with ghee and thrown into milk; on the day following the seeds should be taken out of the milk with greased fingers and the mass separated into single seeds. This process is to be repeated on 10 successive days. Then the seeds are to be carefully rubbed with cowdung, and afterwards steamed in a vessel containing the flesh of hogs or deer. Then the seeds are to be sown with the flesh, with the

¹ Translation of these Stokus of the Britist Sambita are quoted from b. Feal's Positive Science of the H nodes.

fat of the hogs added in a soil previously prepared by being sown with sesame and dug up or trodden down"-and then to be sprinkled daily with water mixed with hshira (चीर) 19 & 20 "To ensure the growth of Ballaris (ie, sprouting and the growth of luxuriant stems and foliage)," Varāhamihira directs, "the seeds should be properly soaked in an infusion of powdered paddy, Māsho (Bean), Sesame and barley mixed with decomposing flesh, and then steamed with Haridrā (turmeric) This process will succeed even with the Tintidi (Tamarindus indica). For the Kapittha (Feronia elephantum) the seeds should be soaked for about 2 minutes (literally such length of time as it would take one to make a hundred rhythmic claps with the palms (নাৰম্ভ:) in a decoction of eight roots : Âsphotu (Jasmine), Amaluki (Phyllanthus embellicus), Dhaba (Grislea tomentosa), Vāsīkā (Justica guaderussa), Vetulo (Calamus rotung), Suryyavallı (Gynandropsis pentaphyla), Shyāma (Echites frutescens) and Atimuktaka (Aganosma caryophyllata) boiled in milk. The seeds then should be dried in the sun. This process should be repeated for 30 days. A circular hole should be dug in the ground, a cubit in diameter, and 2 cubits deep, and this should be filled with the milky decoction. When the hole dries up it should be burnt with fire and then pasted over with ashes mixed with ghee and honey Three

powder of bean, sesame and barley, then again three inches of soil. Finally washings of fish should be sprinkled and the mud should be beaten and reduced to a thick consistency, then the seed previously prepared should be placed in the hole under three inches of the soil and fish washings (with fish) poured. This will lead to luxurant ramification and toliage which will excite wonder. 21, 22, 23, 24, 25 & 26.

inches of soil should now be thrown in then the

The Agnipurāṇa' adds that the mango is specially benefited by cold fish washings (सत्खोदिन श्रोतन श्रास्त्राणां सेन दश्यतं). One can see this process is still resorted to in many mango gardens of Bengal.

Agnipurāna also prescribes pouring of fishwashing as a general measure for luxuriant growth of trees (सत्स्थाश्वसा त सेनेन वृद्धिभैवति शास्त्रिनः)

The same idea of pouring fish-washings as a means of helping development of fruits is conveyed in one of the aphorisms of Khanā which runs thus

"Gourds flourish under the influence of fish washings."

Chakradatta in his Chikitsā-samgraha, under section वातवाधि-चिकित्सा (Treatment of

¹ Chap 194, pp. 305 and 306 (Bengali Translation)

[°] Chap 281 13

[ু] মাত্ৰ জালা লাউ বিডি, etc.

^{*} Sloka 56, pp 293, 294, edited by Pyanmohan Sengupta 1295

Rheumatism), gives a long recipe for the preparation of an oil, where it is said that when a dry barren tree is sprinkled with this oil (at the root) it becomes full of flowers and fruits, graceful and strong (स्तेऽसुनाभूरहा: । सिका: शोवस्पागताय फल्लिन: सिम्धाभवन्ति स्थिरा:)

In the next Sloka 1 he gives another recipe where he says that " if this oil be poured at the root of a dry tree it will sprout and bear flowers and fruits"

"Thus it will be seen that these elaborate recipes are empirical contrivances for supplying the plant with the requisite nitrogen compounds, phosphates, etc., these being potentially contained in the mixtures and infusions prescribed." (Seal).

As to the rotation of crops—in the same field two crops were used to be grown—rice in summer and pulses in winter. Rotation of crops was thus known, and "to India Dr. Roxburgh believes the Western world to be indebted for this system." ²

5. Treatment of plants.—The science of the treatment of plants (Vrikshāyurveda) which

³ Sloke 87

represented by a regular section of the monumental work of Varāhamihir 1 as well as one in Agnipurāṇa. The chapter entitled the "Frilshā-yurveda" or the science of treatment of plants in disease denotes elaborate care.

does not yet technically exist in the West is

Gunaratna in his commentary writes—
"Just as the human body is subject to jaundice, dropsy, shofa (?), emaciation and detects (dwarfness) of finger, nose, etc., etc., so also plants suffer from similar diseases such as 'nception of disease, displacement or dislocation of flower, fruit, leaves, bark."

"And just as by the application of the appropriate remedies unnatural growth, deterioration, wounds, fructures, etc., can be cured, so also in plants by application of proper drugs as prescribed in Vrikshāyuri eda."

Sankara Miśra also in his Upāskara notices application of drugs in plants (भेषजप्रयोग).

Varāhamihii 5 gives the following signs of the diseased condition of plants (एतेश्विक्रेस्तरः सरोगो चेयः).

"Cold climate (low temperature), wind (dryness) and sun (high temperature) are the

Chap of V I

 On Vaisceh ka Philosophy 4-2-7

causes of lisease (When the plant is diseased) the leaves become yellow (etiolated), buds (प्राचानां) do not develop or their growth arrested, branches become dry and the sap (rasa) exudes.'

Kasyapa says "those plants that have yellow leaves (पाण्ड्रो: पतेश), that are fruitless and denuded of leaves and these caused by coldness, excessive heat, too much rain, dry wind and by the intermingling of roots of different plants are to be known as diseased, and are to be treated accordingly."

Treatment.—Remedies are prescribed both preventive and curative.

As a general prophylactic Varāhamihir says.

"As a sort of general prophylactic mud kneaded with ghee and *Vidanga* should be applied to the roots, after which milk diluted with water should be poured" 15.

In the Agnipurana remedies are given almost to the same effect.—" *Vidanga* mixed with rice, fish and flesh—all these mixed together constitute a remedy invigorating to the plants and curative of their diseases." 13.

Turning to curative: A cure is prescribed for that most incurable of diseases—barrenness. Varāhamihir prescribes—" As a remedy against barrenness a hot decoction should be made of Kulattha (Dolichos biflorus). Māsha (Phaseolus mungo var Roxburghn) Mudja Ph radiatus

Tila (Sesamum indicum) and Lava (Barley) which when cooled should be poured round the roots."

Agnipurāṇa—" Vidanga and ghee kneaded with mud and sprinkled with cold water together with Kulattha, Mūsha, Mungo, Yara and Tila should be used in a case of barrenness (फलनांग)."

Almost an identical recipe occurs in the

6. Respiration.—Respiration in plants in the modern sense was perhaps unknown to the ancient Indians. But the injurious effects of carbon dioxide (a gas given out by the plants during respiration) seems to be not unknown to them, a fact which is evident from an injunc-

tion of Manu 1 Thus .

"One should not stay (sleep) during night hours under a tree, nor pass under it."

7. Movements.—Irritability. The phenomena of the movements of plants, their capacity

for sleep, their sensitiveness to touch (contact), heat, wind, noise (thunder), etc., were noticed long ago.

In the Mahābhārata, Sāntiparva, we get

an account of the sensitiveness of plants to touch, heat, thunder, etc.

The Buddhist Scholiast Dharmottara in his

Nyāyavindu Tika a notices the phenomenon of

FLANTS AND PLANTILLY 0 sleep—contraction of leaves in the night (sign) राती पत्रसङ्घीच:) in certain plants (नहि सर्वे हचा:).

named पृथिवीनिरूपण्म् (Prithivinirupanam), notices in plants "the phenomena of life, death, sleep, waking, disease, drugging, transmission of

Udayāna in his Kiraņāvalî,1 in a chapter

specific characters by means of ova, movements towards what is favourable and avoiding what is unfavourable." (इसं प्रतिनियत भोक्रिपिष्ठताः जीवन-मरणखप्रजागरणरोगभेषजप्रयोग-सजातीयान् विदानुक्लोपगम-प्रतिक्रलीपगमाहिभ्यः। प्रसिद्धग्रारिवत्).

Gunaratna in his commentary 2 enumerates the following characteristics of plant life:-Various kinds of movements or actions connected with sleep, waking, expansion, and contraction in response to touch, also movements to-

wards a support or prop.

Gunaratna also gives a list of plants that exhibit the phenomena of Sleep and Waking. He also notices the sensitiveness to touch of plants like the Mimosa pudica (लज्जावती—hence the name) which show a manifest reaction in the form of contraction. (लजालुप्रस्तीनां इस्तादि-

संस्पर्भात् पत्रसंकोचादिकाः)

He also notices that Nelumbium speciosum (lotus) opens with the sunrise; Ghoshātahi (Luffa amara or acutangula) and others in the

¹ Bibliotheca Indica, New Series, 1342 (1912) Fasc III. pp B b others Ind cs New Senes 1151 (907) 8 oks 49 p 157

LI ANT EBUSIOFOCY

Ĺ

evening and Lily with the rise of moon. ''यद्मादीनां प्रातर्विकसनं, घोषात्यकादिपुष्पानां च संध्यायां, न्नसदादीनां तु चन्द्रोदये।"

Šankara Miśra in his Upāskara ¹ also notices plants as characterised by "approaching the

agreeable and avoiding the disagreeable," etc. ''सजातीयानुबन्धानुक्रुलीयगम-प्रतिकृत्वीपगम: सम्भवति ।'' In this connexion we might mention that the

name 'Sūryyamukhî' (Sunflower) for the particular plant—a flower which always faces the rising sun—is significant.

8. Growth.—The stages of growth in plant life are very briefly but comprehensively noted by Gunaratna in his commentary. Thus:

(1) Stages of infancy, youth and age (ৰাল-क्रमार-युव-हडता-परिशाम:)

(2) Regular growth—"Just as man experiences the stages of infancy, adolescence, youth

and old age thereby demonstrating full consciousness, so also do trees." "And just as the human system undergoes constant growth through the stages of infancy, adolescence,

youth, etc., likewise a tree undergoes growth through stages of sprouting, seedling with new leaves, branching and so forth." "वनस्यतिश्ररीर-मरकिङ्गसत्तय-गाखाप्रशाखादिभिर्विग्रेषेः प्रतिनियतं वर्डत इति।"

The conditions of growth seem to be not

unknown to the ancient Indians. Thus:

SBH Vol IV and Gough a Tant at on and Ed tion 4 2, 5,

- (1) I ood—The same Commentator mentions growth or decay by assimilation of suitable or unsuitable food
- (2) Water—(মুল্লায়েছেনে, etc.). The necessity of water as a condition of growth (ব্ৰু) of plants is emphasized by the mythical prophetess Khanā—"Light by day and water by night—these two lead to the growth of strength to plants."
- (3) Light—as a factor for healthy growth is also mentioned Light as a general rule retards growth, absence of light or shade accelerates it. The following aphorism of Khanā very tersely puts the truth:
- "Ol (Amorphophallus campanulatus) grown in a shady place, i.e., in the absence of direct sunlight causes irritation in the mouth, but it is not to be regretted," for what is lost in quality is gained in quantity, i.e., Ol grows in volume in shade which is economically the more important.

"Betel leaf in shade and paddy in sunlight" also testifies the same truth.

But for healthy growth light is necessary is clear from the aphorism already quoted under factor 'water.'

9. Age and Death.—The marvellous longevity attained by plants is also referred to by

¹ "ছায়ার ওলে চুলকায় নৃথ- কিন্তু তাহে নাহি ছুখ" ।

^{*} ছামার পান রৌ দ বান^{*}

ъ3

Gunaratna, in his commentary to the extent

Udayāna also notices in his Kiranāvalî2 death, disease, drugging, etc., in plants. (जीवनमर्णस्प्र-जागरण-रोगभेषजप्रयोग, etc) So also in Upāskara' (जीवनमर्ण, etc.)

10. Consciousness in Plants.—The phenomenon of consciousness in plants was well known to the ancient Hindus, and throughout the whole of their literature we find scattered references unmistakably bearing testimony to

this knowledge. In popular superstition as well as in profound speculation we meet with this testimony. The popular notion of Vriksha-Devatā or presiding deities of trees corresponding to the Dryads of the Greeks is a matter of common knowledge. Some of the Jatakas which are systematised popular stories relating to Buddha, mention the Bodhi-Sattwa born as Tree-spirit for 33 times. And the grammatical

treatise like Kalāpa referred to this prevalent

Bibliotheca Indica, New Series, 1151 (1907), pp. 157, 158

^{239,} etc Shared Book of the Hindus Series, Vol. VI, pp. 159-60. (Panini office) Also A. E. Cough s translation 1873 pp. 147 148

popular belief as to the trees being animated by spirits

Coming from popular belief to profound speculation we meet with precisely the same thing. A verse in the Rigveda¹ is addressed to the plants evidently referring to their possession of the gift of hearing. The practice is repeated both in the Rig and the Atharva² Vedas

Mahīdās Aitareya' includes the herbs and trees along with animals in the organic world According to him plants belong to the last of the four classes of beings, ie, propagated from germs. In his theory of the gradual development of the soul he says, "In herbs and trees, for example, Sap (life) only is seen, but thought (Chitta) in the widest sense is in the higher forms of life." In another place of his Book (I. 2. 4 14) he says, "all forms of life eat and drink All lower animals propagate the species. Even the plants when they are grown up, bear fruits."

Uddālaka says that "the living principle is the potentiality of living bodies—the real seed of things. It is, for example, that potentiality

¹ Rigveda, X, 97 21

⁻ Atharva Veda, XI, 6 10 'In obedience to the thundering voice of the vital breath (praga) that the plants are tecundated, that they conceive and multiply "Di Barua's History of Pre Buddhistic Indian Philosophy I, p 25, 1921

³ Aitareya Âianyaka, I, 5 1 9 , H 6 1.5—Barua, IV, pp. 57 68

or vitality in an infinitesimally small seed from which a large Banyan tree springs into existence. It is the spirit which animates all the parts of a living being. When this spirit leaves any branch of a tree, that withers, i.e., ceases to

PLANT FHASIOLOGY

be an integral part of the living whole, when it leaves another branch, that too withers. And when in this way it leaves finally the whole tree withers and perishes. But the living principle never dies."1

The Manu Samhita distinctly states that the trees are trees on account of their being under the influence of tamóguna (तमोगणः). but they "possess a sort of dormant or latent consciousness, and are capable of pleasure and

pain " (श्रन्त:संज्ञा भवन्तेत्रते सुखदु:खसमन्विता:). According to Maskarin Gosāla? "the plant life or vegetable kingdom, like the elemental life, is possessed of only one sense, the sense of touch But Gosāla admits that plants in general

stand higher in the scale than elemental lives" There is a lengthy, philosophical or rather an analytical exposition of the theme of consciousness in plants in the Mahābhārata, Sāntiparva.4

pp 136.137 ² Manu, 1, 49 3 Barua, ibid, XXI, p. 308

Santaparva 184th Chapter p 855 Ka prasanna Sugha Translat on Basumat Ed tron.

"Brahman, interrogated Bharadway, if bodies both moving and unmoving, are made up of five elements, why do we not then perceive their existence in the immovables? Plants and creepers, can neither hear, nor see or smell, taste or touch. Nor are there in them liquids like blood, the elements of fire (energy), earth represented by bone and marrow, the element of air represented by activity, and the sky (ether) represented by empty space (pore). How then, can they be regarded as constituted of five elements?"

"Brahman," replied Bhrigu, "we cannot indeed perceive the existence of Ether in them through the naked eye because they are solid (इनीस्त), but when we ponder over the fact how they constantly produce fruits and flowers this existence becomes manifest to us. How can we doubt the existence of their gift of touch seeing that their leaves, bark, fruit and flowers wither under the influence of heat? We must infer the gift of hearing in them seeing that their fruits and flowers dry up under the influence of wind, fire and the sound of thunder. Eyeless creatures can never go their way of themselves, and as creepers approach and wind round the trees and move at will, we must admit the existence of sight in them. And as they can be healed of their diseases by the application of odour both pleasant and unpleasant

and also by frankincense of various types. It is sure that they possess the power of sense. The organ of taste in them must be inferred from the fact that they are capable of drinking water through the root. As we suck up water through a lotus stalk applied to the mouth so do plants with the help of air drink up water through their roots. Thus as they are found to be sensitive to pleasure and pain, and as they are seen to undergo regeneration after mutilation, we must admit the existence of life in them. Fire (energy) and air (CO₂) help in the assimilation of the water that unmoving beings like trees take up (from the soil) through the roots."

Udayāna¹ also notes "that plants have a dormant unmanifested consciousness which is extremely dull" (श्रतिसन्दान्त:सज्जित्या, etc).

Gunaratna² in his commentary refers distinctly to the consciousness of plants as a point of similarity between plants and man (श्रत: पुरुषश्रीरतुख्यलात् सचेतनी वनस्रतिरिति). He then elaborates his remarks

Upaskāra³ commenting on Kanāda's aphorism (4 2.5) refers to plants as being the "ground of experience of the consequences of acts." Thus—"Trees and the like also are no doubt

¹ Bibliotheca Indica, New Series, 1342 (1912), Fasc. III, pp. 238-244

so many kinds of bodies being the seat of experience (i.e., the field wherein particular souls reap the consequences of their acts in previous

from below upwards (उत्स्तीतसः).
(2) dormant consciousness (तम:प्राया अव्यक्तचैतन्याः). and

(3) the possession of the sensation of touch (শ্ব-নাৰ্থ্যা).
"Chakrapāṇi notes in the Bhānumati that

the consciousness of plants is a sort of stupefied (darkened or comatose) consciousness (द्वचासु चेतनावन्तोऽपि तमसाक्वजानतया प्राक्षीपदेशविषया एव)." ²
11. Sexuality.—The idea of sexuality in plants as entertained by the ancients in India is highly quaint but vague and inaccurate,

being the result not of scientific observation but of pure poetic speculation from start to finish. The general idea of the division of the

1 3.d Skanda, 10th Chap., Slokas 19, 20, p. 30, with Sridhar Swami's Jormentary Calcutta '294 B B

Dr Seal Pose e Science p 175

plant kingdom into male and female based on human analogy was folded. Thus Harita Samhitā records possibly the earliest fanciful division:—

"Hārīta asks ·

'Why, O sage, is there no conception without the union? Or, why are there no flowers and fruits produced without the union (of the sexes)? Why is the same kind of fruition not to be perceived in women as in the plants?'

Âtreya said:

'The seed, O son, is produced by the cooperation of different sexes among the creeping and the fixed plants, its quality varying according to the sperm (धात्त).

"No two opinions exist as to this, listen O my son, among the fixed plants, all are endowed with sive and soluti, i.e., the male and

the female procreative energies, know this. That which has static (नियकोऽपि) property is to be known as siva, the male, and that which has dynamic property (व्यक्तिशक्ति) is to be known, O the great-souled one, as sakti, the female. The functions of the male and the female arise from their combination. The mango flowers, fruits and stones (embryo within) likewise are endowed with sukra, the generating power."

Charaka¹ is more clear, though not at all more scientific than Hārīta on this point In course of the description of properties, etc., of Vatsaka (Holarrhena antidysenterica) Charaka (Drihḍabal) says the Vatsaka which bears white flowers, large fruits, and tender (Fare:) leaves belongs to the category of males; and that which bears red and yellow flowers and small fruits, small stalk and whose colour is green, belong to the category of females.

Substantially the Hindu knowledge in this respect never travelled further, as we get in Rājanighanţu² a quaint classification of plants into male and female and neuter based on the difference of attributes such as slenderness or

¹ Kalpasthāna, Chap 5 3, p. 1031 (Bengali Edition of D N Sen and U N Sen, 1316 B S.) " इस्त्राल श्रेतपुर्य: पुसान्, ग्रामास्चानु-प्रयो स्त्री। श्रसितज्ञटन (Wrightia tinctoria) Cf. English Translation—Fasc, LXI, lesson 5, Section 3, p. 1940.

Rajanighantu अनुपादि प्रथमी की स्प्रीपु नपु सकालेन वैनिष्ठ eto (Dr Boal p 75)

of the stem and flowers.

The famous lexicon of Amara¹ represents observation as going a bit further, but he gives

stoutness softness or hardness length or shortness, simplicity or complexity of the character

us the very reverse of scientific truth. He confounds the pollens of flowers as corresponding to the female menstruum.

Pliny, the foreign observer, mentions—

"The Indians tell us that in these plants (Indian

Reeds—perhaps Palmyra or Date-palm is meant) also the distinction of male and female obtains, the body of the male being more compact, and that of the female of greater amplitude."

and that of the female of greater amplitude."

Curiously enough in one case⁵ we get the differentiation of sexes in plants based on actual observation. This is the instance of Kelahī (Pandanus odoratissimus). This plant is always

mentioned as a couple (केतकोइयम्); the male one being designated as Sitahetakī and the female one as Svarnahetakī. That the former is a male is emphasised by the author of Bhābaprakās by calling it Ketaka (केतक:). Rājaniphanta dasambas Sitahetakī (mala) as Rankalā

ghantu describes Sitaketakī (male) as Biphalā—not producing fruits; Dhūlipushpikā—having flowers with dusts, i.e., with only pollen grains (microspores). Dhanvantarī Nighantu has

(microspores). Dhanvantari Nighantu has 'Vanaushadhi Varga 50 स्त्रीणा मुसनसा पुष्प' प्रस्नं समस्।

propagation of plants such as by fruits and seeds (vijarūha), by roots (mūlaja), by cuttings (skandhaja), by graftings (स्कन्धे रोपणीया), by ugravija (apical portions), by parnayoni (leaves)

prasatā-yielding a golden harvest, Sugandhinī

12. Reproduction.—Various methods of

and saunarudhaja (?) are mentioned in ancient treatises. Propagation by seeds (Vijarūha) is a very common method which has been known to the Hindus from the very earliest times. The

Rigveda refers to it, the Atharva Veda mentions it in various places. Manui has also mentioned it - "Some of these plants grow from seeds and some from planted cuttings." Propagation by bulbous roots and underground stems (Kandavijam) has been an equally

common method A distinct mention of the method is found in the Arthasastra2 where the tollowing rule is laid down - "Seeds of bulbous roots (Kandavija) with honey and clarified butter are to be smeared with before planting."

Cutting (Skandhavijum) is another method resorted to for the purpose of propagation Manu¹ mentions it. The process is very described in the Arthaśāstra² and

Ann I 48 48 141 Shama Sastr s H v s Irmaa o Arthassetra Ohap 24

FIANT THIS OF (A

Brihat's minta of Varil unit 1 The trimer prescribes that the "seeds of sugarcane and the like are (to be) plastered at the cut end with the mixture of honey, clarified butter, the fat of hogs, and cow dung" before being planted.

Brihat-samhitā enjoins that Kānthāl (Jack fruit), Ašoha (Saraca indica), Kadalī (Plantam), Jambu (Blackberry), Lahacha (Artocarpus lacoocha), Dādima (Pemegranate), Drāksha (Vine), Pālibata, Vājapura (Lemon tree) and Atimuhtaha—all these are to be planted by means of cuttings (आइरोद्धाः). The cuttings are to be besmeared with cowdung and then planted.

4 & 5.

Maskarin Gosāla mentions "sugarcane, bamboo, reeds, etc., propagate from joints."

Better (ut) than cuttings is the process of grafting as recommended by the author of Brihat-samhitā. There are two methods—one consisting in inserting the cutting from one plant into the root of another severed from its trunk. And the second method consists in inserting the cutting of one tree into the stem of another—the cutting is called the scion and the parent plant is called the stock.

5.

Another method is mentioned as Agravija, i.e., plants whose apices are only planted as a means of propagation—Betel is propagated in

B h t somb ts O'ap 54 Vol ' p "#3.

⁵ B XXI p 306

64

this way. This may also mean propagation from

"buddings" (see below).

Then there is the method known as Parnayoni, i.e., leaves serving as a means of multiplication. The present common example of this method of propagation is found in Bryophyllum calycinum and in Begonias.

Lastly, a method—the method of self-

layering is described by Onesikritos 1 thus-" ... there are some large trees from which branches grow out to the length even of 12 cubits. These branches then grow downwards, as if they had been bent until they touch the ground. They next penetrate into the soil and take root like shoots that have been planted. Then they spring upwards and forms a trunk." Pliny 2 also mentions this kind of propagation

That these various methods of propagation of plants were a common knowledge in India will also appear from a dialogue of the Buddha in which the following remarks occur:

with regard to the Indian Fig tree.

"Whereas some recluses and Brahmans, while living on food provided by the faithful, continue addicted to the injury of seedlings and growing plants whether propagated from roots,

¹ McCrindle, Ancient India, Sec. 21 (1901) Book XII, C. (11).

² Dialogues of the Buddha, Part I,-Brahma Jala Sutta 11. Sacred Books of the Buddhists Series, Vol II pp 6 7 (Rhys Dav ds

11 // LTH/201(C.F

or clings or joints or biddi is or seeds Gòtama the recluse holds aloof from

injury to seedlings and growing plants." Buddha Ghosha¹ in his comment upon the passage gives us illustrations of the methods of

such

propagation mentioned above. Thus Mūla-bijam (root-seeds)—Haliddun (Turmeric), Singireram (Zingiber),

Vacam (Acorus calamus). Ativisam (Aconitum heterophyllum), Katukarohini (Picrorrhiza kurroa), Ustram (Andropogon muricatus), etc.

Khanda-bijam (cuttings)—Assattho (Ficus re-

ligiosa), Kacchaho (Cedrela toona), Nigrodha (Ficus benga-

lensis), Pilakkho (Ficus infectoria), Udumbaro (F. glomerata), Kapitthano (Feronia elephantum), etc. Phalu-bijam (joints)—as in Reed.

Agga-bijam (buddings)—the plant Samerana, Anukam (Ocimum basilicum), Hiriveram (Andropogon cynanthus), etc.

Bija-bijam—(seeds)—Pubbannam (7 dhanyas -paddy), Apparannam (Pulses, Cucurbita, etc).

SECTION VI

Ecology: or Study of Plants in their Natural Homes.

Charaka divides land into different regions according to the nature of the soil (edaphic conditions) and climate (climatic conditions) that determine the characteristic vegetation, and also mentions some of the plants characteristic of each region. Thus he divides land into:

- (1) Jangala region—(literally, dry wilderness-reserts; plants—Xerophytes)
- (2) Anupa region (literally, abounding in water; plants—aquatic (Hydrophytes) and marshy (Hygrophytes).
- (3) Sadharana region—(ordinary; plants—
 Mesophytes).
- 1. Jangala region —"The region called Jangala is full of unobstructed open spaces, where a steady and dry wind blows, pervaded with expansive mirages, rivers and rivulets scarce, abounding in well (scarcity of water) also abounding with dry and rough sands and big sandy particles (hankurs)." 1 6 & 7.

¹ Charaka, Kalpasthana J Madanaphala Kalpa, 6, 7 and 9 (verses) For English Translation see Faso, LXI Kalpasthana, Leason 1 pp. 1917 1918 English Translation)

Surrita describes the region as the country which presents a flat surface, and whose dull monotony is enlivened here and there by scanty growths of thorny shrubs, and tops of a few isolated hills and knolls, and in which the waters from springs and wells, accumulated during the rains, become nearly drained, and strong gales of warm wind blow (during the

According to Charaka the following are the plants that grow in this region Khadu a (Acacia catechu). Asana (Pentaptera tomentosa), Aśvakarna (a variety of Shorea robusta). Dhara (Conocarpus latifolia), Tunisha (Dalbergia oojeinensis), Sallakī (Boswellia serrata), Sāta (Shorea

robusta), Somavalha (Acacia arabica), Vadarī (Zizyphus jujuba), Tinduka (Diospyros glutinosa), Ašwattha (Ficus religiosa), Vata (F bengalensis) and Āmlakī (Phyllanthus emblica). The predominant types of trees are . Samī (Mimesa

greater part of the year,."

sumo), Arjuna (Pentaptera arjuna) and Simšapā (Dalbergia sisoo)—these are all xerophytic 6 & 7.

2. Anupa region.—(Marshy or swampy and

watery.)

Swampy—" mostly abounding in rivers and bordered by seas, swept by cold wind, ie,

charged with abundant moisture. The country

Sutrasthans Chap 35 verses 34-42 For English Trans ation
see Yol 1 pp 320 36

noterspersed with rivers banks of which are decked with—Vañjula (Calamus cotung) and Vānīra (Calamus Roxburghii of the aquatic variety) Mountains are absent from this region. The region is thickly overgrown with forests, bowers and trees in flowers encircled by verdant trees and tender creepers.

The land is covered with dense forests of $Hint\bar{a}la$ (Phænix paludosa), $T\bar{a}la$ (Borasus flabelliformis), $Tum\bar{a}la$ (Cinnamomum tamala), $N\bar{a}m-kela$ (Cocos nucifera) and Kadali (Musa sapientum).—Charaha.

Subjuta describes this region as the country that contains a large number of pools, and is wooded and undulated with chains of lofty hills traversing its area, and which is impassable owing to its networks of rivers and sheets of accumulated rain water rippling before the currents of the gentle, humid air."

Varāhamīhīr¹ mentions the following trees as growing in Anāpa region:—Jambu (Eugenia jambolana), Fetasa (Calamus rotung), Vānīra (Calamus sp.), Kadam'ra (Anthocephalus cadamba), Udumbīra (Ficus glomerata), Arījuna (Terminalia arjuna), Vijapuraha (Citrus medica), Drāhšhā (Vīnes), Lakucha (Artocarpus lakoocha), Dādīma (Pomegranate), Vānjula (Calamus sp.), Naktamāla (Caesalpinia bonducella), Tīlaka (Sesame), Panāsa (Jack fruit), Tīmīra (?),

Amrataka (Spondias mangifera),—these 16 kinds of trees are the predominant species of this region." 10 & 11.

Aquatic plants (Hydrophytes)— Amara mentions the following plants as growing exclusively in water —

Saugandhika, Kalhāra . White water-lily

Hallaku, Raktasandhyaka Red variety Ttpala, Kubalaya ... Any other water-lily. Indîvara A blue one. Kumuda... Nymphæa lotus

(esculent white sort). Padma, Kamala Nelumbium speciosum (lotus). Pundarīka, Sitāmbhoja . . A white lotus

A red lotus.

Fārīpar ņi Pistia stratiotes. Mushākarni Azolla, Salvinia. Jalanīli, Saivāla Vallisparia, and the green algae. 3. Sadharana-or the ordinary.-Charaka

says-"That region which is endued with creepers, and plants and trees of both the classes, i.e., the Vanaspati and Vānaspatya, is 9. called Sādhāruna.

According to Susrutu a country which exhibited features common to both the aforesaid classes is called Sādhāruņa or ordinary."

Amarakosha Patalavarga 50-56 / Luebockes Ed on (1807) ook I Cusp Se of Aquat: Pants 38-42

Kokanada, Baktotpala

In the s rj rja of ma akosha the following trees—Māndāra. Pārijātaka, Santāna, Kalpaviiksha and Hanchandana are mentioned as five celestial ones; and they seem to be alpine (mountainous) trees, as according to Hindu mythology Heaven or the abode of gods, is situated at the top of the Himalayas.

Plant Association.—In some places plants of a particular species predominate over others, and the place is given the name of the species dominating there to the exclusion of others. Such as ¹:

Kumudiati. Kumudini—the place where white water-lilies predominate; place abounding in lotus is called Padmini. Nalini: where reeds abound it is called Nadiat, Nadvala; one abounding in ratans is called Vetaswān, in green grasses Sādiala (মাহন:).

Even rivers abounding in particular species are known by the species dominating—such as Sarāvati abounding in sara (reeds) and Vetravati abounding in Vetra (ratans).

The names Kuśadwipa, Plakshadwipa, Sālmalidwipa, etc., for the different islands in the Purānas, may be indicative of places where these particular plants—Kuśa (Poa cynosuroides), Plaksha (Ficus infectoria), Sālmali (Bombax malabaricum), etc., predominated.

SECTION 'II

TAXONOMY

1 Nomenclature.—The naming of plants

constitutes a highly interesting topic, full of historical and cultural significance, showing us at once a good deal of the accurate knowledge of the geography of India, and throwing

an interesting sidelight upon the brisk intercourse among the different parts of India, and giving us unmistakable proofs of the power

In the second volume of his "Botanical Observation on Select Indian Plants" Sir William Jones, the President-Founder of the Asiatic Society, Bengal, writes—

"I am very solicitous to give Indian plants their true Indian appellations, because I am fully persuaded that Linnaeus himself would have adopted them had he known the learned

and ancient language of this country, etc."

The plants 2 have been named according to—

A Special association:

of scientific observation.

(i) Bodhi-druma (Ficus religiosa)—so called after Buddha's attaining nirvāņa under it

A Review XXXIIL

Only a few ples under each are given as lustration,

- (n) \$ / 1 (Saraca indica) so called after legendary association with Asoka forest in which Sītā, that pink of chastity, was confined.
- (in) Snaschhara (Datura)—as the flower is associated with Siva, the Indian god of destruction
 (iv) Yaqñadumura (F. glomerata)—associated with sacrifice—Homa.

B. Special property:

- (a) Medicinal ·
 - (i) Dadrughna (Cassia fistula)—that which cures ring-worm.
 - cures ring-worm.
 (ii) Arŝoghna (Amorphophallus campanu-
 - (ii) Arśoghna (Amorphophallus campanu latus)—that which destroys piles.
 - (iii) Sothayhna (Boerhavia repens)—that which destroys dropsy—ædema.
 (ir) 1byathā (Myrobalan haritakī)—that
 - which takes away pain
 (v) Kusthanāsınī (Somaraji)—that which
 cures leprosy (skin disease).
 - (vi) Lodhra (Symphlocos racemosa)—that which stops ocular discharge.
 - (b) Domestic utility:
 - (i) Vānīna (Cane)—it is desired for making houses.
 - (11) Dantadhābana (Acacia catechu)—required for cleansing the teeth

TROKETE

- (111) harpusu (Cotton)—that out of which clothes are weaved.
- (ii) Dhanadruma (Bambusa)—that out of which bows are made.
- (r) Lehhana (Reed)—from which lehhana (pens) are made.
- (vi) Agmmantha—(Premna spinosa or serratifolia)—gathered for kindling fire.

C. Special characteristic features:

- (i) Phenda (Soap berry)—its seeds give lather or foam with water.
- (11) Bahūpāda (Ficus bengalensis)—many legged—with prop or pendent roots serving as so many legs.
- (iii) Situsāna (Diospiros sp.—a sort of ebony)—black is its wood.
- (iv) .Itmagupta (Dolichos pruriens)—selfprotected fruits having been provided with spiny hairs, also highly poisonous.
- (v) Charmin (Bhojapatra)—with wide charma (bark)

D. Special morphological features:

- (a) According to the number of leaflets in the compound leaf:
 - (i) Dwipatra (Bauhinia)—evidently wrong.
 - (ii) Tripatra (Wood apple)—with three leaflets

- (iii) Saptapurna (Echites scholaris)—with seven leaflets.
- (b) Nature or shape of leaf
 - (t) Diryhapairaka (Cane-ratan)—with very long leaves.
 - (ii) Kîsaparnî (Achyranthes sp.)—leaves having the shape of the ear of a monkey
 - (111) Mūṣikapaṛni (Salvinia)—whose leaves resemble the shape of the ear of a mice.
 - (iv) Asvaparnaka (a variety of Shorea robusta)—leaves resemble the shape of the ear of a horse.
 - (v) Pañchāngula (Ricinus)—with palmate and five-ribbed leaves.
 - (vi) Kantakapatrikā (Brinjal) having prickly leaves.
- (c) Shape and colour of flowers:
 - (i) Vahrāpuspa (Sesbania grandiflora)—with papilionaceous flowers.
 - (ii) Hemapuspa (Michelia champaca)—flowers having the colour of gold.
- (d) Miscellaneous:
 - (i) Satamuli (Asparagus)—with hundred roots (many).
 - (ii) Sataparvihā (Grasses)—hundred (many) joints (parva) in its stem.
 - (iii) Twaksāra (Bamboo)—with hard (woody) skin

-14XOXOMY

- (iv) Drimotp l (Pterospermi m iceri fol.um)—lotus-like flowers on wood.
- (v) Apuspaphalada (Jack-fruit)—fruit without (apparent) flowers.

E. Local association:

F.

- (i) Saubîra (Zizyphus jujube)— indigenous of Saubir (Sourāshtra).
 - (11) Chāmpeyā—(Michelia sp.)—indigen-
 - ous of Champā—Bhagalpur.

 (111) Māgadhí (Jasmine or Piper longum)—indigenous of Magadha—
 North Behar.
 - ous of Odra—Orissa or China?

 (v) Vaidehi (Pepper)—indigenous of Videha—Mithilā—North Behar.

(iv) Odrapuspa (China rose)—indigen-

(vi) Drātidaka (Pīta šathi)—indigenous of Dravid—the Decean

Environmental association: (i) Nadisaryja (Arjun—Terminalia

- arjuna)—grows on the banks of rivers.
- (ii) Jala_la (Hijal—Barringtonia acutangula)—grows in water.
- (iii) Vūnaprastha (Bassia latifolia)—grows in woodlands.
 - (iv) Pankerūha (Lotus)—grows in mud.
 - (v) Maruvaka (Ocimum sp)—grows in deserts

cold mountain

(rii) Kutaja (Holarrhena antidysenterica)—grows on mountain peaks.

G. Other characteristics:

G. Other characteristics:

(i) Fukula (Mimusops)—often cited by

(vi) Hemavali (Myrobalan)—grows on

poets
(ii) Situbhīru (Jasmine)—dics in (afraid of) winter.
(iii) Māghya (Kunda)—flowers in Māgha

(February).

(ii) Śāradi (Jussieua repens or white lotus)—flowers during Autumn (Sarat).

(v) Tishyaphala (Phyllanthus) — fruits in Põus (December-January)
 (vi) Bhutābāsa (Bayeda) — ghosts haunt these plants.

It may be noticed that the Hindu nomenclature of plants went further in this direction, being not satisfied with giving them denominations after particular features. It gave most of the plants double names—one based on a salient external feature (परिचयन्नापिका संजा), and the other on some prominent medicinal or

other properties (गुणप्रकाशिका संज्ञा). Thus.

1. The plant Sesbania grandiflora is known as Vakrapushpa (curved flowers) i.e. with papilionaceous flowers and also Vranari

- (the fee of boil) on account of its preven tive property against that malady
- 2. Rieinus communis is known as Chitravija (having painted seeds), Triputiphala (with trilobed fruits), and also Vātārī (the enemy of rheumatism).
- 3 Balanites Roxburghii is known as Tikshnakantaha (having sharp thorns). Tailaphala (having oily seeds), and also \@lart (destroyer of pains).
- 1. Achyranthes aspera is known as Kharamanjara (having long and rough spikes), and Kinthi (killer of itches, boils, etc.).
- 5 Linum usitatissimum is known as Nîlapushpíkā (blue-flowered), and Pichchhilā (having slippery, ie. mucilaginous seeds). 3 Calotropis gigantia is known as Kshîruhāndaha (having stems with milk), Tūlāphala (having wooly fruits), and Kharjjū-
- ghna (ringworm-killer). 7. Cassia fistula is known as Swarnapushpa (with golden flowers), Dirghaphala (long fruits—lomentum), and Kushthasūdana (curer of leprosy).
- 8. Datura alba is known as Kantaphala (having spiny fruits), Ghantāpushpa (having bellshaped flowers), and Mahāmohî (great intoxicator)
- 3 Indigofera tinetoria is known as Nilapushpi blue flowered and Ranja is (dver

- 10 Butea frondosa is known as *Iriparna* (tri foliate), and *Kshāra-śreshtha* (chief of alkalies).
- 11. Acaeia arabica is known as Yngmakanta (with two spines), Mālāphala (having beaded fruits) and Kaphāntaka (ender of cough)

- 2 Classification of Plants The Hindu classification of plants was based upon three listinct principles, namely.
 - A. UDBHIDA—BOTANICAL,
 - B. VIRECHANADI-MEDICINAL,
 - C. ANNAPĀNĀDI—DIETIC.
 - A. Classification on Botanical Principles.

—A broad classification of plants, probably based on stature, into Trees, Shrubs, Herbs and Creepers is to be found as early as in the texts of the Rigveda. Plants were further classified into those that bore fruits and flowers and those that did not.

Manu's classification of plants is distinctly clear. According to him:

- (1) Those that bear abundant flowers and fruits, and wither after fructification are called Oshadhis, e.g., Rice and Wheat (annuals).
- (2) Those that bear fruits without evident flowers are called *Vanaspatis*.
- (3) Both those which produce flowers only and those which produce fruits only may be classed as *Vrikshas*.
- (4) Bushy herbs of various types may be classed as Guchehha, e.g., Jasminum ($Mallik\bar{a}$ and the like).

- (a) Succellent shrubs of various types are known as Gulmas.
- (6) Grasses of different kinds are called Trinas.
- (7) Creepers with stems spreading on the ground (procumbent and decumbent) are called *Pratānas*.
- (8) Lastly there are those which twine round or climb a tree or a support called *Vallis*.

Charaka classifies plants into four orders.

Vanaspatis, Virudhs, Vānaspatyas and Osha-dhis.

- (1) Vanaspatis—are trees that bear fruits without flowers.
- (2) Vānaspatyas—are trees that bear first flowers and then fruits.
- (3) Oshadhis—are those herbs that wither after fructification.
- (4) Virudhs—are herbs with spreading stem, e.g., creepers and gulmas. (जतागुरमादि:).

Chakrapām, as Dr. Seal points out, notes in his Commentary on Charaka—Virudhs comprise two classes. (1) Latās—creepers, and (2) Gulmas—herbs with succulent or cactaceous stems and shrubs. The Oshadhis are subdivided into (1) annuals or perennials, bearing fruit, and (2) plants that wither away after maturing and

without fructification, e.g., grasses like the $D\bar{u}rr\bar{u}$ (Cynodon daetylon).

Suscruta¹ lays down almost an identical classification of plants. Thus "the immobile Oshadhis (plants in general) in their turn admit of being grouped under four sub-heads, such as the Vanaspatis, the Vrikshas, the Virudhs and the Oshadhis proper.

"Those trees which bear fruit without blossoming are called Vanaspatis; those that bear both fruits and flowers are called the Vrilishas. Shrubs and creepers that trail on the ground are called Virudhs, whereas those plants which die with the ripening of their fruits are called Oshadhis proper."

The commentator Dalrana, as summarised by Dr. Seal, gives us some details, ie, illustrations of each class. The Plahsha (Ficus infectoria) and the Udumbara (Ficus glomerata) are given as instances of trees bearing fruits without flowers (Vanaspatis). It appears that plants with naked and incomplete flowers (achlamydeous flowers) were considered as flowerless, as also trees whose flowers, like those of the fig, are placed on the internal walls of a common receptacle (hypanthodium). Of the Vrikshas, flower and fruit-bearing trees, the mango tree, the Jambu tree (Eugenia jambolana), etc., are

⁻ Sütrasthäna I 23 also of Eng Trans Vol I p 12. Sea Pos ve Science p 70

PLANTS AND PLANT LIFT

given as examples The Virudhs are of two elasses—(1) creepers with stems spreading on the ground (प्रतानवस्थः), and (2) herbs with succellent or (cactaceous) stems (युद्धिमन्दः or

स्तिक्वः: वर्तुल्लतासन्तिविधिष्टाः). Oshadhis are those that wither away after fructification. e.g., wheat, barley, etc. (फल्लाकनिष्ठा गोधमादयः). Some divide Oshadhis into two classes

(1) those that wither after bearing fruits, e.g., paddy, linseed, pulses, etc, and

(2) plants that wither after maturity, and bear neither flowers nor fruits, e.g., the much-room, etc."

room, etc."

The Vaiseshika commentator *Prasastapāda*¹
gives us a nicer classification of plants under

six heads. Thus plants are divided into Trinas, Oshadhis, Virthshas, Latās, Avatānas and Vanaspatis. (खावरा कृषीपधिष्ठचलतावतानवनसम्बद्धः दित). Trinas are grasses. Oshadhis are herbs that wither after fructification. Vrihshas are trees bearing flowers and fruits. Latās are spreading and creeping herbs. Avatānas are arboraceous plants and shrubs. And Vanaspatis

are trees bearing fruits without flowers.

Sridhara in his Nyāya Kandali gives us illustrations of each of the above classes:—Thus Ulapa (Imperata arundinacea) as an example of Trina, wheat as an example of Oshadhi, Kovidāra

The Vizianagram Sanskrit Series Vol IV p 28 Be---- 1895 The Viz m Sanskrit Series, Vol IV p 28 1895

(Pandanus odoratissimus) and Fijapuruka (Citrus medica) as examples of Aratānas (Vitapas-arboraceous plants, Seal) and the Udumbara (Ficus glomerata) as an example of Vanas-

५-,}

(Bauhinia) as an example of Frilst Lata is too well known to need any illustration, Ketahi

illustrations of these classes which are almost identical with the preceding. Thus these are the plants: (1) Vrikshas—are plants that bear flowers

 ${\it Udaganāchāryya}$ in his ${\it Koranīvali^{-1}}$ gives

and fruits and have trunks and branches. (स्तन्द-शाखिन:). (2) Trinus-are Ulupus and plants of that

type. (3) Oshadhis-are plants that wither after fructification, such as Kalama (a species of

paddy). (4) Gulmas—are plants like Bhāthās

(**ਮਾ**ਠਾ: ²). (5) Latās—are plants such as Kushmānda

(a species of Cucurbita) and the like. (6) Aratānas—are Ketakīs and plants of

the type. (7) Vanaspatis—are trees that bear fruits without flowers.

patî.

Bibliotheca Indica New Series No. 1342 (1912). Pass

£

(J

The same authority in his selection of articles erroneously mentions palm as a further illustration of Tripas (ऋण्यहणेनेव तालादय:), and sesamum and paddy of Oshadhis (शोषध्यहणेनेव तेलवख्लादय:)

The classification given in the Bhagavatapurāṇam' is almost the same. It, too, classifies them under six heads (वनस्पत्योषधिसतात्वज्ञारावीक्-धो द्रमा:)—

- (1) Vanaspatis—those that hear fruits without flowers.
- (2) Oshudhis—those that wither after fructification.
 - (3) Latās—those that climb on others.
 - (4) Twaksāras—those that have hard bark (নক) like bamboos.
 - (5) Virudhs bushy shrubs.
- (6) Drumus—those that bear both flowers and fruits.

Amara's classification of plants is very interesting being full of details showing a further advance in knowledge, and we cannot here do better than fully utilise the masterly summary done by so great a writer as Dr. B. N. Seal:

^{&#}x27; 3:d Skanda, 10th Chap, 19th Verse, with Sridhard Swain's Commentary.

Seal, Positive Science of the Ancient Hindus, pp 171-173
(191

- (1 Inc tr (the flowern /s/s and the flowerless i anaspatis) are fruit-bearing and possess woody stems काष्ट्रहरू or nunks (प्रकाण्ड-प्रकाण्ड-स्कन्धः स्थान्त्रज्ञात् प्राखाविस्तरः).
- , (2) Arboraceous plants and Shrubs (ন্যু. ছুল্লেম্ব্রিয়ান্ত:) bearing flowers as well as fruits.
- (3) The Lutās are next noticed, flowering plants with herbaceous stems, some of them creeping on the ground (प्रतानिनी), others succulent (गुन्सिनी), others twining or voluble (मूलाचायंगता लता, त्रचगामिनी लता) Cf Susruta— लताप्रतानवत्य: गुल्सिन्यश्व।
- (i) Next the Oshadhis (in the narrower sense), herbaceous plants bearing fruits with or without flowers and dying or withering away after fructification. Some instances of Kandu-sāka (tubers, rhizomes, corms) are noticed, e.g. Palāndu (the onion. प्रवाण्ड्रम् सुवन्द्वाः), the Lasuna (garlie महाकन्द), etc. But the graminaceae enumerated in the Vaisyavangu are the chief instances of the Oshadhis—plants that die after fructification. These are cultivated Oshadhis but their affinities with the next class, the grasses (Trinus) are also noted (e.g. धान्यं नींडासः, etc.).

Next are enumerated—

(5) the Trinus, grasses of which the characteristic is the formation of gulmus (culms of grasses with annulai knots fr in which leaves

spring—स्तको गुल्लो द्वणादीनामकाण्डद्रमगुक्क्कयोः). It

the grasses, the bamboo is considered as a sort of giant grass (द्रणावज:). The reeds (नलादय:) are also placed among the grasses (नलादयस्यां गर्मच्याशाकपसुखमपि । प्रमुख्यान्दात् नीवाराद्याः).

(6) Finally, the Palmaceae (including the cocoanut, date, areca, and other palms) are classed as Tree-grasses, probably because, like

is worthy of note that, in the enumeration of

the grasses they are endogens characterised by spikes and parallel veins (ऋषदुमः).
 "I (Seal) may add that Amara places parasitical plants among the Latās (वन्दा, हचादनी, इस्हा, etc.). They climb trees and feed upon them (Cascuta). These are to be distinguished from climbing plants, like the Guduchi (Tinospora cordifolia), which have separate roots of

their own. They are also to be distinguished from the adventitious roots descending from the branches of trees, like the Ficus religiosa, which are usually termed Abarohas (अवरोहा:).

The Hindu Materia Medica mentions Ahásavalli, literally sky-creeper, a name which seems to have been originally intended for some orchids; also Plaia (lit. floating), weeds that float in stagnant ponds, and Saivāla, mosses and lichens (?) (e.g., द्वांक्सेर्युवर्णेवालं, etc., Chahrapārianska, also Plaia (Planaka)

float in stagnant ponds, and Saivāla, mosses and lichens (?) (e.g., दूर्व्याक्तिश्वर्यवानं, etc., Chahrapā-ni-saingraha, also Bhāba Prakāŝī). These are not classified, but like the mushrooms must come under the Pahinishtha aushadhis

Aushadhis that die after in turing without bringing forth flowers or fruits, ie. cryptogams. We have so far discussed the classification

of plants according to their stature and some salient vital features which represents just the first step in the scientific classification. In the next step the individual plants are sought to be

arranged into certain well-defined groups, genera or classes according to resemblances in their essential characteristics The individual plants coming under such a group, genus or class, in their turn are differentiated by certain specific

features, primarily, the colours of their flowers. Thus: 1. The genus Koudara (Bauhinia) includes the Swetapushpa Koridara (flowers white),

the Pitapushpa Koridara (flowers yellow-B. tomentosa) and the Raktapushpa Koridāra (B. purpurea) which resemble in almost all their essential characteristics but differ in the colours of the flowers. The Swelapushpa Kovidāra is again differentiated into Swetakovidāra nur-

gandha (B. acuminata), and Swetahovidāra surabhikusuma (B variegata) according as the flowers are not scented or scented. 2. Similarly the genus Balā (Sida) includes

4 species (बला चतुष्टयम्)—Balā (Sida cordifolia), Atibalā (S. rhombifolia), Mahābalā (S rhom-

boidea) and Nagabala S spinosa

- 4. The genus Sigru (Moringa), includes 3 species (शियुत्रयम्)—Swetā-sigru (flowers white—Moringa pterygosperma). Rakta- or Madhu-sigru (flowers red) and Sovāñjana (flowers blue)
- 5. The genus Śarapunkhā (Tephrosia) includes 3 species (प्रापुद्धावयम्)—Rakta-śarapunkhā (flowers red—T. purpurea). Sita-sarapunkhā (flowers white—T villosa) and Kantapunkhā (T. spinosa).
- 6 The genus Sankhapushpi (Canscora) includes 3 species—Śuklapushpi (C decussata), Raktapushpi (C. diffusa) and Nilapushpi (?).
- 7. The genus Bhringarāja (Eclipta) includes 3 species (खेतपीतनीखप्रयमेदात् स्त्रयो सङ्गराजा: सन्ति) Sweta (flowers white—E. alba), Pita (flowers yellow (?)) and Nila (flowers blue (?)).
- 8. The genus $P\bar{a}tal\bar{a}$ (Stereospermum) includes $T\bar{a}ma$ -pushpa $P\bar{a}tal\bar{a}$ (S suaveolens), Pita-pushpa $P\bar{a}tal\bar{a}$ (B. chelonoides) and Sita $P\bar{a}tal\bar{a}$ (Schrebera swietenioides).
- 9. The genus Chandona includes Swetachandona (Santalum album—गन्धराजं, सर्पादासं, मचयञ्जम्) Rakta chandona (Pterocarpus

santalı s प्रवानभन्तम् मसराम् At l la (Adenanthera pavonia—रज्ञकाष्टम्, पटरञ्जनम्), Kālīpakā (१ प्रोतकाष्टम्, नारायणप्रदस्) Barbaraka (१ खेतम् निर्गन्सम्) and Horumanasha (महागन्धः, खोडितम्).

10. The genus Kośātakī (Luffa) includes Kośātakī (L echinata), Kshudraphalā (L. bindaal), Brihatphulā (L. graveolens), Rājakośātakī (L acutangula), etc., etc.

B Classification of Plants based on Medicinal Properties.—Charaka¹ classifies plants primarily into two divisions—Purgatives (विरेचन:) and the Astringents (कार्यः). And the Pargatives are six hundred and the Astringents are five hundred in number. The number of pre-eminently astringent groups are fifty which might again be sub-grouped under ten heads or Vargas, thus

1 First Varga:

- (1) Jivanīya (Prolonging life)—e.q., Jīvaka (Celtis orientalis), Jiudgaparņī (Phaseolus radiatus), Māshaparņa (Teramnus debilis), Jīvanīī (Dendrobium sp.), rest not identified.

 6.
- (2) Vrimghaņiya (Nutritive and promoting corpulency)—e y., Rājakshāraka (Asclepias rosea). Balā (Sida cordifolia), Bharadwājī (Hibiscus vitifolius), etc.
- (3) Lelhaniya (Thinning the tissues or reducing corpulency)—c.y, Musta (Cyperus rotandus), Kushtha (Aplotaxis auriculata) Haridrā (Curcuma longa), Dāruharidrā (Berberis asiatica), etc 9.
- (4) Bhedaniya (Promoting excretion)—e g., Arka (Asclepias gigantia), Chitr \bar{a} (Rubia

^{&#}x27; Charaka Samhatā, Sutrasthāna, IV, pp. 25-29 (Bengah Edition). Cj. also Eng. Trans., Fasc. II, Lesson IV, pp. 27-47

man ishthi, (hit ala (Pimbago zevlanica) Swai nahshti ini (I olanisia felina). 10.

- (5) Sandhāmiya (Premoting the union of fractured parts)—e.g., Liquorice, Madhuparni (Tinospora cordifolia), Lodhra (Symplocos racemosa), Priyangu (Aglaia Roxburghiana), Katphala (Myrica sapida), etc. 11.
- (6) Dipaniya (Promoting appetite and digestion)—ry., Pippeli (Piper longum). Charyo (Piper chava), Sringuvera (dig ginger), Maricha (Piper nigrum), Ajāmodā (Apium involucrata), Bhallātalā (Semecarpus anacardium), etc. 12.

2. Second Varga:

- (1) Valya (Increasing strength)—Rishari (Mucana pruriens), Atirasa (Asparagus racemosus), Payasya (Convolvulus paniculatus), Aśwagandhā (Physalis flexuosa), Sthirā (Desmodium gangeticum), Rohini (Picrorrhiza kurroa)
- (2) Varnya (Improving the complexion)— Chandana (Pterocarpus santalinus), Tunya (Calophyllum inophyllum), Mañnshthā (Rubia cordifolia). Santa (Hemidesmus indicus), etc

14.

(3) Kanthya (Improving voice and curing hoarseness)—Ikshumūla (Saccharum officinarum), Diākshā (Uvōē passāē), Vidārī (Convolvulus paniculatus), Hamsapadī (Hydrocotyle asiatica), etc.

= (4) $Hrilia$ (Promoting c	heerfilness or
relish)—Amra (mango), Amrāte	aka (Spondins
mangifera), Nil. ucha (Artocar	pus lakucha),
Mātulunga (Citrus medica), etc.	16

3 Third Varga:

- (1) Kaphaghna (Removing phlegm that causes a sensation of satiety)— Vidanga (Embelica glandulifera), Murvā (Sauseviera zeylanica), Guduchā (Tinospora cordifolia), Patóla, etc. 17.
- (2) Aršaghna (Curing piles)—Kutaja (Holarrhena antidysenterica), Vilva (Aegle marmelos), Atuvisha (Aconstum heterophyllum), Abhayā (Terminalia chebula), etc.
- (3) Kusthaghna (Curing skin-diseases)— Khadira (Acacia catechu), Suptapaina (Echites scholaris), Aragvadha (Cassia fistula), Karavira (Nerium odorum), etc. 19.
- (4) Kanduqhna (Curing prurites)—Chandana (Red sandal), Nalada (Nardostachys jatamarsi), Nahtamāla (Galedupa indica), Numua (Melia azadirachia), etc 20
- (5) Knimighna (Anthelmentic or Vermifuge)—Akhira (Moringa pterygosperma), Kcruha (Costus speciosus), Niigunthi (Vitex nirgundo), Kinihi (Achyranthes aspera), etc. 21.
- (6) Vishaqhna (Neutralising poison)— Suvahā (Vanda Roxburghii), Palinda (Ichnocarpus frutescens), Kataka (Strychnos potatorum Sirisha Mimosa sirisa) etc. 22

Fourth Varea Z.

(1) Stanyojanano (Galactiphorous)-	-Tîran
(Andropogon muricatum), Sāli (paddy)	. Shesh
ula (paddy), Durbha (Saccharum cyline	drieum)
Kuša (Poa cynosuroides), etc.	28
(2) Stanyaśodhana (Improving the	quality
of milk)—Pāthī (Stephania hernanditolia	.), Sura
dāvu (Cedrus deodara), Masta (Cyperus	s rotan

dus), Kirātatikta (Agathotes chirayita), etc. 21. (3) Suhrajanana (Increasing the secretion of semen)-Jivaka (Celtis orientalis), Vriddharaha (Asparagus racemosus) Jatila (Phyllanthus piruri), Kulinga (Rhus acuminata), etc. 25

(4) Śuhrośodhana (Purifying the semen)— Kushtha (Saussure a auriculata), Kadamba (Nauclea cadamba), Ikshu (Sugarcane), Kāndekshu

26

(Ruellia longifolia), Iāsuhu (Sesbania grandiflora), etc.

Fifth Varga:

(1) Snehopaga (Emollients)—Mildvīkā (Raism), Vidāri (Convolvulus panieulata), Jārantā

(Coelogy re ovalis). Sīlaparnī (Hedysarum gange-27ticum), etc (2) Sucdopaga (Diaphoreties)—Sobhañjana

(Moringa pterygosperma), Ehāranda (Ricinus communis), Vischiia (Boerhavia diffusa var white), Punamarā (red variety), etc 28

(3) Vamanopaga (Emetre)—Kovidāra (Bauhinia variegata) Karou lara (B. acumii ata - V 16

(Nuclea)	1	lul i	Calamus	fasciculatus)	Vimbi
(Coccinea	in	dica),	Sanapush	oī (Crotalaria	verru-
cosa), etc.					29.

- (4) Frechanopaga (Purgative)—Kūchmārya (Gmelina arborea), Parushaka (Grewia asiatica). Abhayā (Terminalia chebula). Pīlu (Salvadora indica), etc 30.
- (5) Asthāpanopaga (Enemata)—Trivrit (Convolvulus turpethum), Pippali (Piper longum), Mustard. Vacha (Acorus calamus), Madanaphala (Randia dumetorum), etc. 31.
- (6) Anuvāsanopaga (Oily enemata)—Rusnā (Vanda Roxburghii), Sālapushpa (Pucedanum sowa), Ašuadamgshtrā (Tribulus terrestris), Agnimantha (Premna spinosa), etc. 32
- (7) Strovirechanopaga (Errhines)—Jyotishmoti (Cardospermum halicacabum), Ksharaka (Myriogyne lanuginosus), Sveta (Clitorea ternata) white and red variety, etc 33

6 Sixth Varga:

- (1) Chhardiniqrahana (Relieving vomiting) Jambu (Eugenia jambolana), Amra (mango), Mātulunga (Citrus medica), Amla-radara (a variety of Zizyphus), etc 34.
- (2) Trishṇānigiahana (Relieving thirst)— Nāgara (Cyperus partenuis), Dhānwa-yavāsaha (Hedysarum alhagi), Parppataha (Oldenlandia biflora), Patola (Trichosanthes dioica), etc. 35.
 - (3) Huccā nigrahamı (Relieving biccup)

Sth (C c rivin i) the last of macquinis), the a (Solatum indicator, with sharuhu (orchid), etc. 26.

7 Seventh Varga:

- (1) Purisha-samgraha.āya (Rendering the fæces consistent)—Kātaunga (Colosanthes indica), Mochanisa (Bombax malabaricum), Samānaga (Mimosa padica), Dhātahī pushpa (Grislea tomentosa), etc. 37.
- (2) Parisha-virajaniya (Altering the colour of the fæces)—Śallahi (Boswellia serrata), Śwweshtaka (Pinus longifolia), Payasaā (Batatas paniculutus). Utpala (Nymphaea stellata), etc 38.
- (3) Mūtra-samgrahoniya (Reducing secretion of the urine)—Plahsha (Ficus infectoria). Kapītāna (Spondias mangifera), Ašu attha (Ficus religiosa), Bhallātāha (Semecarpus anacardium), etc. 39.
- (4) Mūtru-tirechaniya (Promoting secretion of urine)—Vrikshādani (Cascuta), Aśwadam-qshtrā (Tribulus terrestris), Vuśnia (Cleome viscosa), Pūshānabheda (Bryophyllum calycinum), etc. 40.
- (5) Mātra-virajanīya (Altering the colour of the urine)—Padma (Nelumbium speciosum), Utpala (Nymphaea stellata, blue), Nalina (Nymphaea, white), Kumuda (Nymphaea, red), Saujar dhika (Nymphaea, lotus) I undarīka

(Nelumbium sp.). Satupatra (Nelumbium sp.), etc. 41

8 Eighth Varga:

- (1) Kāsahara (Curing cough)—Durālabhā (Hedysarum alhagī), Šrīngī (Rhus acuminata), Drākshā, Abhayā, Āmalakī, Pīppalī, Kantakārīka, etc. 42.
- (2) Śwāsaharu (Curing difficult breathing or Asthma)—Sathi (Circuma zerumbet), Cardamoms, Amlaretasa (Rumex vesicarius). Hingu (Ferula assafætida), Aguru (Aquilaria agallocha), Surasā (Oseimum sanctum), Chandā (Andropogon acicularis), etc.
- (3) Sotha-ham (Curing anasarca or dropsical swellings)—Pātalā (Bignonia suaveolens), Prishnipamī (Doodia lagopodioides), Gohshura-ha (Tribulus lanuginosus), etc. 44
- (4) Jwarahara (Febrifuge)—Sarivā (Asclepias pseudosarsa), Pāthā (Stephania hernandifoha), Pīlu (Salvadora indica), Abhayā, Āmalaha, Vibhītaha, etc 45
- (5), Śramahara (Removing fatigue)—Diāhshā, Kharjūra (Phoenix sylvestrix), Piyāla (Buchanania latifolia), Vadara, Phalgu (Ficus glomerata), Ikshu, Yava, Shashtika, etc. 46.

9 Ninth Varga:

(1) $D\bar{a}haprasamana$ (Relieving heat of the body or burning of the skin) Iaja (Paddy fried)

Cla la Santa im illum) \Motpela (blue lotus), Hruera (Pavonia odorata), etc. 47

- (2) Šītaprašamana (Relieving sensation of coldness)—Tagara (Bignomia chelonoides). Dhān-yaha (Coriandrum sativum), Šringarera (Zingiber officinarum), Bhūtika (Ptychotis ajowan), etc. 48
- (3) Udarddaprasamana (Curing urticana)— Tinduka (Diospyros melanoxylon), Piyāla, Asana (Terminalia tomentosa), Arimedā (Acacia farnesiana), etc. 49
- (4) Angamarddaprasamana (Relieving pain in the limbs)—Vidāriqandhā (Desmodium), Vrihatī Kaṇtakārī, Kairanda (Ricinus), Chandana, Cardamoms (large), etc. 50
- (5) Sūlaprašamana (Curing pain in the howels)—Maricha (Piper nigrum), Ajāmodū (Apium involucratum), Ajāgandhā (Cnidium diffusum), Ajājī (Cuminum cyminum), etc. 51.

10. Tenth Yarga:

- (1) Somitasthāpana (Styptics) Rudhira (Saffron, Crocus sativus), Mel, Liquonice, Mocha (Plantain), etc. 52.
- (2) Vedanāsthāpana (Anodynes)—Sāla (Shorea robusta), Katphala (Myrica sapida), Tunga (Calophyllum inophyllum), Ašoka (Saraca indica), etc. 53
- (3) Samjñāsthāpana (Restoring consciousness Kartaryya Melia sempervirens Vayastha

ĥ,

(Gratiola mounieria), Golomi (Corydalis govaniana), etc 54

- (4) Prajūsthāpana (Curing sterility)— Aī drī (Karivia umbellata), Šatarīryya (Cynodon daetylon), Abhyāthā? (Musa sapientum), Vātyāpushpī (Sīda cordifolia), etc. 55.
- (5) Vayasthāpana (Preventing the effects of age)—Amrīta (Tinospora cordifolia), Dhāttrī (Phyllanthus emblica), Manduhaparaī (Hydrocotyle asiatica), Punarnavā (Boerhavia diffusa), etc. 56

Classification according to Susruta1 -

Susruta classifies plants (drugs) under thirtyseven sections or ganas. They are as follows:

1. The Vidarigandhadi Group.—Plants of this group have the virtue of subduing the action of deranged $V\bar{\nu}yu$ and Pitta (bile) and prove beneficial in Sosha (phthisis). Gullia, Urddhaśwāsha (asthma) and cough.

Plants are—Vidārigandhā, Sahadevā, Šutāvarı, Vrihatī, Jīvāka, Kuntakārī, etc.

2. The Aragvadhadi Group—These have the effect of destroying deranged phlegm, the effects of poison and Meha (morbid discharges from the urethra), Kustha (skin disease), fever, vomitting and itching of the body, etc., etc.

^{&#}x27;Sütrasthâna, Chap. XXXVIII — Ceneral classification of drugs according to their therapertical properties, pp. 342-356, Eng. Translation

Plant are M to A ejetche K st ja I where Pate a, S aptoparate, N intera, Patole G which, etc.

3. The Varunadi Group —These are efficacious in cases of cephalaegia, gulma and internal abscesses, etc.

Plants are-Voruna, Pūtika, Agnimantha.

Vāsuba, Vilia, Ajāšni igī. Darbha, etc.

4 The Viratarvadi Group—The plants have the property of curing all urmary troubles

Plants we—Piratara, Gundea, Nala, Kusa, $K^{-\frac{1}{2}}$, Ashmabhedaku, etc.

effect of destroying the germ of Kashtha, proves beneficial in case of $P\bar{a}\mu duroga$ (Chlorosis or Jaundice)

Plants are— $S\bar{a}las\bar{a}ra$. $Aj\bar{a}karna$, Khadara,

5. The Saiasaradi Group -These have the

Kālashandha, Bhārija, Meshuśringī, Timsha. Chanuana, etc.

6. The Rodhredi Group.—" The group is antidotal to the deranged Kapham, etc., astringent in its properties, removes vaginal and uterine disorder, etc.

Plants are—Rodhra, Palāša, Ašoka, Katphala, Kadomba, Šāla and Kadalī.

7 The Arkadi Group —Acts as a vermifuge, and a specific asceptic agent amongst other properties

Plants are—Aika, Karanja, Nugadunti, $Rasn\bar{a}$, $Indrapushp\bar{i}$, etc.

8. The Surasadi Group.—Acts as above, besides proving beneficial in "catarrh, non-relish for food, asthma and cough."

Plants are—Surasā, Bhustrina, Sugandhaka, Vidanga, Kākamāchi, Nirgundī, etc

9. The Mushkakadi Group.—Has the effect of "removing the defects of semeu," efficacious in Meha, piles, jaundice, chlorosis, gravels, and urinary calculi in the bladder, etc

Plants are-Mushkaka, Palāša, Dhava, Chitrika, Madana, Šimšapā, Triphalā.

10. The Pippalyadi Group—Acts as a good appetiser, and is an absorbent of intestinal mucous and unassimilated lymph chyle.

Plants are—Pippalī, Chavya, Maricha, Elā, Sarshapa, Hingu, Aticisha, Vacha, etc.

11. The Eladi Group—It is a cosmetic, and arrests the eruption of pimples, etc.

Plants are—Elā, Tugara, Priyangu, Aguru, Ushīra, Punnāga, Kešara, etc.

12. The Vachadi and Haridradi Groups.— Are puritiers of breast milk, and curative of mucous dysentery ($\hat{A}m\bar{a}tis\bar{a}ra$).

Plants are—Vacha, Musta, Abhayā, Bhadradāru, Nāgakešara, Haridrā. Dāruharidrā, Kutaja etc 13. The Syamadi Group.—It cares that menal glands and acts as an anti-toxic and is one of the most reliable purgatives in cases of obstinate constipation of bowels with suppression of arme, etc.

Plants are—Svāmā, Travit, Dantī, Rājuvrīksha, Suvarņakshīvi, Kovašja, Gavākshī, etc

14. The Vrihatyadi Group.—Is a good digestant or assimilator of the deranged humours; proves efficacious in "nausea, water-brash, dysuria," etc.

Plants are-Vrihati, Kantahurika, Madhuka.

15. The Patoladi Group.—Is februfuge, etc., restores appetite, etc.

Plants are—Patola. Chandana, Murvā, Katurohinī, etc.

16. The Kakolyadi Group.—Increases the quantity of milk in the breast. It is a restorative, and an elixir, and is endued with the therapeutic virtue of augmenting the virile potency of a man.

Plants are— $K\bar{a}holi$, $Kshira-k\bar{a}koli$, $Mudga-pan\bar{n}$, $Med\bar{a}$, $Mah\bar{a}med\bar{a}$. $Chhinnaruh\bar{a}$. Padmaka, Riddhi, Vriddhi, etc.

17. The Usakadi Group — Cures gulma, urinary calculi, etc.

Plants are-Hingi Kasisi and Tuttl k

18. The Sarivadi Group.—Allays thirst, cures haemoptysis, removes burning sensation $(d\bar{u}ha)$ of the body.

Plants aro—Sunvā, Madhuka, Chandana, Kāshmārīphala, Ushīra, etc

19 The Arjanadi Group.—Anti-toxic, allays internal dāha, and cures haemoptysis.

Plants are—Añjanā, Nāgapushpa, Priyangu, Nīlotpalu, Nalada, Nalina, etc.

20 The Parushakadi Group —Acts as a cordual, increases appetite, etc

Plants are—Parushaka, Drākshā, Katphala, Dādīma, Rājādana, Katakaphala, etc.

- 21. The Priyangvadi Group.—Consists of Priyangu, Dhātakī, Mocharasa, Rusāñjana, etc.
- 22 The Amyashthadi Group Favours the healing of ulcers, bring about the adhesion of fractured bones, and dysentery $(p\bar{a}hv\bar{a}tis\bar{a}ra)$

Plants are—Amuashtha. Rodhra, Nandiviiksha. Katvanga, etc.

2' The Nyagrodhadi Group —Proves beneficial in cases of ulcers, disorders of uterus and vagina, favours the adhesion of fractured bones, cures haemoptysis, etc.

Plants are—Nyagrodha, Udumbara, Aścattha, Plaksha, Madhuka, Kapitāna, Āmia, Jambu, Kadamb: Vadari Ind La Bhallataka etc 24 The Guduchyadi Group.—Is a good appetiser, and acts as a general februage, etc.

Plants are—Gaduchi, Nimen, Kustumenia Chadana and Padmaka

25. The Utpaladi Group.—Allays thirst and proves curative in cases of vomiting. *Hridrogu* (Angina pectoris), in syncope, in haemoptysis, and in cases of poisoning too

Plants are—Utpala, Ruktotpala, Sauganahika, Kuvalaya, Pundarika

26 The Mustadi Group.—Cures uterine and vaginal disorders, purifies mother's milk, acts as a good digestant.

Plants are—Musta, Haridrā, Haritaki, Āmalukī, Vibhītaka, Harmavatī, Drāvidī, Bhallātaka, etc

27. The Triphala Group.—Is a good appetiser, improves the eyesight and proves beneficial in chronic intermittent fever (iishama-jvara)

Plants are -- Haritaki, Amalaki and Tibhitaka

28. The Trikatu Group.—Destroys rat and Kapha, Meha cures abdominal glands, catarrh dullness of the appetite and indigestion.

Plants are—Pippali, Maricha and Sringavera

29 The Amalakyadi Group.—Acts as a general febrifuge; it is also an aphrodisme, and acts as a general tonic or restorative and appetiser

Plants are—Amaiahi, Hu itahi, Pippali, and Chitraha.

- 30 The Trapvadi Group.—(all metals)
- 31 The Lakshadi Group —Acts as a vermi fuge, asoptic agent in cases of bad, malignant or indolent ulcers

Plants are $-L\bar{a}ksh\bar{a}$, $Arevat\bar{a}$, $Kuta_{|a}$, $Aśva-m\bar{a}\iota a$, Nimva, Saptachchhada, $M\bar{a}lat\bar{\iota}$.

- 32. The Svalpa Panchamula Group —It is a tonic, and aphrodisiae Roots of . Trikantuka, Viihatī (two species), Prithakaparnī and Vidārigundhā.
- 1 33 The Mahat Panchamula Group.—It appetising. Roots of Vilva, Agnimantha, Tuntukā, Pātalā and Kāsmāri.
- 34. The Dasamula Group.—It proves beneficial in cases of Asthma and difficult respiration. The preceding Mūlas combined.
- 35 The Valli Panchamula Group.—Roots of five medicinal creepers: $Vid\bar{q}r\bar{z}$, $Sariv\bar{a}$. $Rajan\bar{z}$, $Guduch\bar{z}$ and $Aj\bar{u}\hat{s}ring\bar{z}$.
- 36 The Pancha-kantaka Group.—Five medicinal thorny shrubs: Karamardda, Trikantaka, Sāirīyaka, Satāvarī and Gridhranakhī.
- 37. The Pancha-trina Group.—Five medicinal herbs (of the grass species), known as, Kuša Kāša Nala Darbha Kāndekshuka

- -1
- C Classification of Plants based on Dietic Value.—Charaha 1 classifies plants also on the basis of dietic value under the following rargas (groups):
- (1) Šūka-dhānya rarge, (2) Samī-dhānya varga, (3) Šūka varga, (4) Phala varga, (5) Hareta varga, (7) Ikshu varga and (6) Āhārayogī varga (oil)
- 1 Suka-dhanya varga—(all bearded grains), ie, those paddies that are provided with husks (glumes). "This group is subdivided into the following classes according to their tastes, potency and assimilation"
- (1) Sālı.—They are cooling in their potency, in taste and assimilation they are sweet, capable of exciting the wind, a little constipating, oily, nutritive, and increasing semen and urine 8-10. The group includes—the red Sāli, the Mahāsalı (grown in Behar-Magadha), Kalamu (grown in Kashmir), Sakunāhrita (grown in Sravanti), Chūrnaka, Dīrghasūka, Gaura, Pānduka, Lāngula, Sugandhika, etc., etc. Vāpya (is a species that grows in deep water), Naishadhaka (grows in the country of Nishādhas), etc.

¹ Sütrasthäna, Lessons XXVII, pp 329-334 and 344 (Fasc. XI), pp 345-362, 371-374 (Fasc. XIII), and pp. 380-381 (Fasc. XIII), English translation.

(2) Shashteha— It is cooling, only,	heavy,
agreeable, destructive of all the three	faults,
and invigorates the body, and makes it	hard."
The group includes two species wh	ich are
white and dark.	14.

- (3) Baraka, Uddālaka, Chīna, Sārada, Gandhala, Kuruvinda, Ujjwala and Durddura—are like (2).
- (4) Vrihi—This variety is sweet, sour in assimilation, provocative of the bile and heavy.

 16.
- (5) $P\bar{a}tala$ (Åsu-dhānya gathered in the month of Aswin)—increases fæces, and urine, enhances the heat of the body and provokes all the three faults.
- (6) Shyāmaka (Panicum frumentaceum)—is astringent, sweet and light.
- (7) Nīvāra, Toyaparnī, Gavedhuka, etc., etc., all resemble Shyāmaka in their virtues (many of them are not paddy proper). 19-20.
- (8) Yava (Hordeum hexastichon) or barley—is dry, cooling, heavy, agreeable, etc. 21.
 - (9) Venuyava—a variety of the above, 22.
- (10) Godhūma (wheat. Triticum vulgare)—unites fractures, cooling, prolongs life, promotes nutrition, enhances the semen, etc. 23.
- (11) $N\bar{a}nd\bar{\imath}mukh\bar{\imath}$ and $Madhul\bar{\imath}$ —Varieties of wheat.

Thus $Dh\bar{a}nya$ includes grains of almost every species

PANONOMY E)
It will be noticed that all the above come under the modern family Graminaceae
2. Sami-dhanya Varga.—It includes—
(1) Mudga (Phaseolus mungo)—astringent,
sweet in taste, etc. It is the foremost of all
things whose soup or boiled juice is taken. 25.
(2) Māsha (Ph radiatus)—increases the
semen, etc. (26). Varieties of Māsha are—Rāja-
māsha (Dolichos sineņsis), Kulattha (Dolichos
bifforus). 27 & 28.
(3) Makushtaka (Phaseolus sublobatus)—is
beneficial in haemorrhages, fevers, etc. 29
(4) Chanaka (Cicer arietinum).
(5) Mosūra (Cicer lens).
(6) Khandika (Pisum sativum) and other
kinds of pulses and peas are light, cooling,
etc They are beneficial in affections of bilious
phlegm. 30-31.
- •
(7) The different variety of beanswhen

phlegm. (7) The d oilified, are fit to be eaten by men endued with 33. strength.

(8) Adhaki (Cajunus indicus). (9) Nishpava (Vigna catjang). (10) Atma-gupta (Mucana pruriens). (11) Umā (Atasī-Linum usitatissimum,

Linn.). (12) Elagaja (Cassia tora).

All the above 12 kinds belong to the family Leguminoseae (Per family

It is curious to note that *Tila* (Sesamum indicum, *Tiliaceāe*) and *Avalguja* (Vernonia anthelmintica, *Compositeae*) are included in this group.

3. Saka Varga (Pot-herbs)—Group of Vegetables—parts used are leaves, stems and

PLANIS AND PLANT LIFL

108

fruits (include also bulbous roots).—

(1) $P\bar{a}th\bar{a}$ (Stephania hernandifolia), $Sush\bar{a}$ (Cassia sophora), $\bar{S}athi$ (Circuma zerumbet), $V\bar{a}stuka$ (Chenopodium album), Sunishannaka (Marsilea quadrifoliata)—these are astringents

which dry the fluids of the body. 89.

(2) Kūkamāchī (Solanum nigrum)—increases the vital seed, it also cures leprosy. 90.

(3) Rūjakshūraka (Asclepias rosea)—is specially applauded in diseases of the Grahaņī and

Piles.

(4) Âmrul śāk—(Oxalis corniculata)—provokes the digestive fire, destroys the effects of poison and dropsical swellings

(5) Kālaśāka (Corchoras capsularis), Mandu-

kaparņī (Hydrocotyle asiatica), Vetūgra (Calamus rotang), Karkhotaha (Momordica mixta), Patola (Trichosanthes dioica), Somarājī (Vernonia sp.), Vrishapushpa (Justicia adhatoda), Sārngashthā (Abrus precatorus), Kevuha (Costus speciosus),

(Abrus precatorus), Kevula (Costus speciosus), Punarnavā (Boerhavia diffusa), Kulāya (Pisum sativum), Gojihvā (Elephantopus scaber), Vārttāku (Solanum melongana) Tilaparnika

Cleome pentaphyla, hulaka Momordica

charanta) Nu va (Meln azad racita) I an pataka (Oldenlandia bifiora)—all alleviate excitements of phleam and bile. (6) All kinds of kitchen vegetables, such as mungo, cicer. phaseolus, etc., Chlercdendron siphonanthus, a variety of Chenopodium album, Phlomis zeylanica, Dioscorea globosa, Ocimum sanctum, flowers of Crotalaria juncea and Bombax malabaricum, Bauhinia acuminata, Linum usitatissimum, Vigna catjung, Bauhinia variegata, Achanthes triandra, Beta bengalensis, Amarantus oleraceus. Convolvulus repens. Hibiscus canabinus, Rumez visicarius, Cucurbita pepo, etc these are heavy and dry. They are sweet in taste, cooling in energy, and (after digestion) purge the intestines of their contents without producing watery motions 97-103. (7) The flowers of Sana, Bauhinia, Bombax,

etc, are inspissant and are much applauded in cases of bilious haemorrhage in especial. 104.

(8) The leaves of Ficus bengalensis, F. glomerata, F religiosa, F infectoria, Nelumbium speciosum and others are astringent in taste, operate as stambhanas, are cooling,

(9) Tinospora, plumbago, Pothos officinalis, Aegle marmelos, Asparagus racemosus, Sida cordifolia, Caelogyne ovalis are capable of alleviating both wind and bi e 106 107

etc

- (10) Gloriosa superba (I ingulil a) and Ricinus are purgatives.
- (11) Sesamum, Calamus rotang—also purgative.
- (12) Sāha of Kausambha (safflower)—alleviates phlegm and enhances bile. 108-109.
- (13) Cucumis sativus, C melo, Cucurbita lagenaria—purgative. 110-112.
- (14)*Nauclea cadamba—possesses inspissant qualities. 113.
- (15) Nymphaea stellata is astringent and alleviates bilious haemorrhage.
- (16) Kharjjūra and Tāla-šasya—are alleviative of bilious haemorrhage in Phthisis. 115.
- (17) The stalk, flowers and fruits of both Kumuda, Utpala, Nymphaea lotus, Scirpus kaysoor, Trapa bispinosa, etc., are cooling, etc. 116.
- (18) The bulbous roots of Convolvulus paniculatus (Vidāra) prolong life. 120.
- 4. Phala Yarga (The Group about Fruits). The fourth order includes the following fruits:

Mridvika (Vitis vinifera)—It enhances the vital seed, its use is various and important 124-125.

Kharjjūra (Phœnix sylvestris)—beneficial in phthisis, etc 126.

Phalgu (Figus hispida)—promotes nutrition, etc

I ristak and M II k (rewis islatica and Bassia latifolia)—are applauded in cases of wind and bile. 127.

Amrātaka (Spondias mangifera)—it operates as a tonic by increasing strength. 128.

Tālu (Borassus flabelliformis)—its kernel, and Nāmkelu (Cocos nucifera)—its fruit, operate as tonic for increasing the strength. 129.

 $Bh\bar{a}vya$ (Dillenia speciosa)—corrects the taste of mouth 130.

Vadara (Zizyphus jujuba), Araka (not identified), Karkandhu (Zizyphus anoplia), Lakucha (Artocarpus lakoocha)—provoke bile and phlegm.

 $P\bar{a}r\bar{a}rata$ (Anona reticulata—according to Wilson) is of two varieties. 133.

Kāśmārya (Gāmbhārī—Gmelina arborea) and Tuda (Morus indica). 134.

Tanka (a variety of wood apple of Kāshmir), Kapittha (Feronia elephantum)—destructive of poison, etc. 135-136.

Vilva (Aegle marmelos)—both ripe and unripe. 137.

Amia (Mangifera indica)—unripe and ripe. When ripe subdues the wind, and conduces to flesh, vital-seed, and strength. 138.

Tāmvara (Eugenia jambolana), Simvītīka (Pulses), Gangeruka (Hedysarum lagopodioides). Karīra (Capparīs aphylla Vimbi (Coccinea

FLANTS AND LLANTILL 112 indica) T dana (Grewia asiatica) Dlanvini (another variety of Grewia), Ripe Panasa (Artocarpus integrifolia), Mochā (Plantain). Rājādanī (Mimusops indica), Lavalī (Anone reticulata), Nīpa (Nauclea cadamba), Śatāhvaka (Aruthum sowa), Pīlu (Solvadora indica), Trinasunya (Pandanus odoratissimus), Vihantaka (Flacourtia sapida), Prāchīnāmalaha (Flacourtia

cataphraeta), Ingudī (Ximenia aegyptiaca), Tinduka (Diospyros glutinosa), Amalaka (Phyllanthus emblica), Vibhītaka (Terminalia belerica), Dādima (Punica granatum), Amlika (Tamarindus indica), Amlavetasa (Rumex vesicarius),

Mātulunga (Citrus medica), Nāgaranga (Citrus auranticum), Bātāma (Amygdalus communis), Abhishuka (Pestā), Ahshota (Juglans regia), Muhulaka (Croton polyandrum), Piyāla (Buchanama latifolia), Sleshmātaka (Cordia myxa),

Añkola (Alangium Lamarkii), Samī (Acacia suma), Karañia (Pongamia glabra), Vārtāka (Solanum melongana), Parkatī (Ficus infectoria), Akshiki (Dalbergia o ijeinensis), Aśwattha (F. religiosa), Udumbara (F. glomerata), Plaksha

(Figure 1), Nyugrodha (F bengalensis), Bhallataka (Semercarpus anacardium),—the individual properties of all the above fruits, their parts to be used, are described. 139-164. It will be seen that the above is almost the

exhaustive list of fruits that are used by the present inhabitants of India

5. Harita Yarga (The Group of Greens) — Irdraka (Zingiber officinale), Jameira (Citrus sp.) promote the appetite. Mālaka (Raphanus

sativus) is destructive of all the faults Surasā (Ocimum sanetum), Yamānī (Ptychotis ajowan), Sigru (Moringa pterygosperma), Sāleya (Cicer arietinum), Vilshtaka (Sinapis ramosa).

Jalapippalī (Commelyna salicifolia) Gandina (Kidney bean), Tumburu (Zanthoxylum alatum), Bhūstriņa (Andropogon schoenanthus), Dhānyaha (Coriandrum sativum), Griñjanaha (Turnips,

also a variety of Garlie). Palāndu (Onion)

and Lasuna (Garlic-Allium cepa and Allium sativum).

165-176
Properties of each and every one of them are described.

6. Äharayogi Varga (The Oil Group).—

The oil of Sesame is sweet, capable of penetrating even the minute nerves of the body and hot. It is the foremost of all things that are destructive of wind. If improved by admixture with other articles the oil of sesame is regarded as capable of alleviating all diseases. It is a tonic, it improves the skin, memory and intelli-

tonic, it improves the skin, memory and intelligence and the digestive fire.

The oils of Eranda (Ricinus communis),

Mustuad seeds, the oil of Piuāla seeds (Bucha-

Musturd seeds, the oil of Piyāla seeds (Buchanania latifolia), the oils of Atasī (Linum usitatiesimum) Kusumhha (Carthamus tinctorius)

tatissimum), Kusumbha (Carthamus tinctorius)
these oils are described with properties 294

Suśruta's classification is more systematic and elaborate.

- 1. Sali Dhanya—includes several species, such as Lohitaka, Sali, Kalama, Pānduka, Sītabhiruka, etc. They are sweet in taste, cooling in potency, light of digestion and impart strength to those who use them. They are diuretic, spermatopoietic, refrigerent, eye-invigorating, cosmetic, tonic and pleasant. The properties of Sāli rice grown on burnt land, in a jāngala country, in kaidāra or marshy country, once transplanted (10pya) or those transplanted several times in succession (atiropya) are described.

 4-7: 15-19.
- 2. Shashtika Group—includes several species of Shashtika, Kanguka, Peetaka, Churnaka, Kuraka and the Kedāraka, etc. They are sweet in taste and digestive, pacify the Vāyu and Kapham. They are constructive, tonic and spermatopoietic. The Shashtika especially is light, mild, demulcent and imparts strength and firmness to the body

 8-11.
- 3. Yrihi Dhanyas—include several species such as Krishna Vriha, Sālamukha, Jatumukha, Nandimukha, etc. They are sweet and astringent in taste, hot in their potencies. 12-14.
- 4. Kudhanya Yarga.—The several varieties are: Koradūshaka, Syāmaka, Nīvāra, Uddālaka,

¹ Sütrasthäna, Chap. XLVI, Vol., I, pp. 469-526 (English Translation which treats of food and drink—Annapäna Vidhimadhäya).

Ven lact etc. They generate heat and have a sweet and astringent taste. They include four varieties (black, red, yellow and white) of Priyangus (Panicum italicum) 21-26.

- 5. Vaidala (Several varieties of pulses) known as—Mudya. Vana-mudya, Kalāya, Makushtha, Masura, Māngalya, Chanaka, Satina, Triputaka, Harenu, Adhaki, Māsha, etc. They are generally cool and pungent of digestion, and have a sweet and astringent taste. Then he describes the properties of each of the abovementioned pulses. Atmagupta is included in this group.
- 6. Tila and its varieties—(Sesamum and its varieties)—the black variety is the best in respect of efficacy, the white species occupies a middle position, while the remaining species are inferior.

 39-40.
- 7. Yaya (Barley) is cooling, sweet; Godhāma (wheat) is sweet, heavy, tonic, rejuvicient, spermatopoietic and improves the relish for food.

 41-44.
- 8. The Simya (Bean) with its four varieties—are heat-making. They are antitoxic, discutient, and reduce the Kapham and the power of sight. The four varieties are white, black, the yellow, and the red.

Kusumva, Linseed (Atasī) and white mustard are mentioned with their properties

9 Phala Yarga (The Fruit Group)
includes Dādīma, Amalaka, Kapittha, Vadara,
Kolā, Karkandhu, Sauvīro, Simitikaphala,
Mātulunga, Amra, Amrātaka, Karamardda, Piyāla,
Lakucha, Bhāvya, Pārācata, Vetraphala, Prāchīnāmalaka, Tintidika, Nopa, Koshāmia,
Amlika, Nāranga, Jamiīra, etc

They are acid in taste, and heavy of digestion, heat-making in their potency, (expectorant) of Kapham, generate Pittam and subdue the $V\bar{a}yu$.

Two varieties of Jameīra are mentioned—such as Airāvata and Dantašatha

The fruit (of such trees as the Aśwatiha, the Pluksha, the Udumbara, etc., which pass by the general name) of Kshīra-Vrikshas, as well as those which are known as—Jamvu, Rājādana, Todana, Tinduka, Vakula, Dhaniana, Aśwatara, Aśwatara, Phalyu, Parushaka, Gāngeruka, Pushkara, Varti, Vilva, Vimvī, etc., are cooling and astringent in their effect.

The fruits, such as, $T\bar{a}la$, $N\bar{a}rikela$, Panasa, and Maucha, etc., are sweet in taste and of digestion and subdue the $V\bar{a}yu$ and Pittam.

The fruits, such as, $Dr\bar{a}hshas$, $K\bar{a}shmaryas$, Madhukas, $Kharjj\bar{u}ras$, etc., have a sweet taste, are heavy of digestion and prove curative in cases of hæmoptysis.

The fruits such as Vātāma, Akshoda, Abhishuka, Nichula, Pichu, Nikochaka, Urumāna,

etc are demulcent heat making in their potency, constructive, tonic, sweet in taste.

The fruits known as Inacata and Dancasatha, Laculi (aromatic and refreshing to the
whole system), Vasiram, Sītapākyam, Bhallātaka,
Imqudam, Sleshmöntaka are described with
their properties
Fruits such as Karira, Akshaka, Pīlu, Tima-

sūnya have a sweet, bitter and pungent taste and heat-making in their potency. The Anahama, Tauvanaha, the Kanañya Kimsuka and Anshtaphalam (Nimia), curative in cases of leprosy, gulma (internal tumour), ascites, piles and prameha.

The Vidanga, the Abhayā (Chebulic myrobalans), the Aksham, Pugu; the fruits and vegetables, such as, the Iātikosha, Jātiphalam, Katakaphalam, Kakkolakam, Lavanga and the Karpāra are described with their extensive properties

The Latā-kasturī, the Piyāla, Vibhātakī, Kolā, Îmalaka, Vījapuraka, Shampāka and Koshāmra are sweet in taste, digestion, appetising, demulcent, etc

The Vilvas, both green and ripe, with their properties are described and recommended.

139-210.

10. Saka Yarga (The Group of Pot herbs)
The fruit of such creepers as Pushpaphala.
l-b \(\) and \(K\bar{a}\) lindaha Of the 1\(l\bar{a}\) bus two

varieties are described Tender Kushmāndas are recommended

The fruits such as the Trapusha, Errāruka, Karharu, and Sīrna-vrintu—are described. A green and tender cucumber is distinguished from one which is of a pale yellow colour

The spices and herbs include—the Pippalī, Marīcha, Śringavera, Ārdraka, Hingu, Jīraka, Kustumvuru, Jamviraka, Sumukha, Surasā, Arjaka, Bhūstriņa, Sugandhaka, Kāsamardda, Kālamāla, Kviheraka, Kshavaka, Kharapushpa, Šigru, Madhu šigru, Phamijhyakā, 'arshapa, Rājikā, Kulāhala, Veņu, (fandira, Tilapārnika, Varshābhu, Chitraka, Mūlaka, Potikā, Lašuna, Palūņdu and Kalāya, etc. Their properties, individual and several, are described.

The leaves of plants and trees known as the Chuchchu, Juthika. Tarunī, Jīvantī, Vimvitika, Nandī, Bhallālaka, Chhāgulāntrī, Vrikshādanī, Phañji. Sālnalī, Selu, Vanaspati-prasava, Saṇa, Karindāra, Kovidāra, etc. the leaves of Punarnavā, Varuņu, Tarkuri, Uruvaka, Vatsādanī, Vīlva—are described.

The pot-herbs such as *Tunduliyaka*, *Upodikā* Aśvabala, *Chilli*, *Pālankya*, *Vāstuka*, etc., are mentioned with properties.

The pot-herbs (leaves of edible plants) such as the Mandukaparni, Saptalā Sunishannaka, Suvarchalā, Brahma-suvarchalā, Pippuli, Guduchi, Gophoā, Kākamāchi Prapunnāda Avalguja

Sitina Villat ih l K t k l pl li P t l
Vārtāku, Kāravellaka, Katukikā, Keivka, Uravuka, Parpataka, Kirātatikta, Karlatoka, Arishta,
Koshātakī, Vetra, Karira, Atarusāka, Arkapushpī, etc., are light and palatable, and prove
curative in haemoptysis, Kushtha, Meha, Fever,
Dyspnoea, Cough, and create a relish for food.

211-280.
11 Pushpa Varga (The Flower Group).

Sana and Sāimalī, prove curative in cases of haemoptysis The flowers of Vrisha and Agastya alleviate phthisis (wasting cough). The flowers of Madhu-śigru, Karira, Raktavriksha, Nimva, Mushkaka, Arha, Asana, and Kutaja trees subdue Pittam, and prove curative in skin diseases (Kushtham)

—The flowers of such trees as the Kondara,

The Padma, Kumuda, its two varieties—Kuvalaya and the Utpala, the Sindhuvāra, the Mallikā, Mālatī, the Vahulas, the Pātalā, the Nāga, the Kumhuma, the Champaka, Kumšuka, Kurantaha—their properties are observed and recommended.

281-289.

12. Udbhida Yarga (As sprouting up from

beneath the surface of the ground—Udbhida).

—Only one plant—Mushroom—is described under this head—its properties according to its place of origin, such as, stacks of straw ($Pal\bar{a}lam$), on Bamboo (Venujam). Sugarcane (Ikshujan) Cowdung (Karisham and

Bhumij m etc are minutely observed and recommended. 290-293

'' पलालेचुकारीषवेणुचितिजानि ''—२८३।

13. Kanda Varga (The Bulb-group—edible bulbous plants or herbs).—The bulbs of plants and creepers, such as the Vidārīkanda, Satavārī, Viśa (bulbs of the lotus plants), Mrmāla (stalk of the lotus leaf), Sringātaka, Kašeruka, Piņdāluka, Madhvāluka, Hastyāluka, Kāsthāluka, Sankhāluka, Raktāluka, Indīvara, Utpala, etc., alleviate haemoptysis, tend to increase the semen in large quantities and augment the quantity of milk in the breast of a human mother. 298-312

The bulbs (kanda) known as $Sth\bar{u}la\text{-}kanda$, Suranakanda and $M\bar{a}naka$ tend to produce a state of dryness in the organism. The toppiths of such trees as $T\bar{a}la$, $N\bar{a}rikela$, $Kharjj\bar{u}ra$, etc., are also included in this group.

14. Taila Yarga¹ (The Oil Group).—
Sesamum oil, Castor oil, oils obtained from the seeds of Nimva, Atasī, Mūlaka, Jīmūtaka, Vrikshaka, Kritaxedhana, Arka, Kampillaka, Hastikarņa, Prilhvika, Pīlu, Karañia, Ingudī, Sigru, Sarshapa, Suvarchalā, Vidanga.

The oils obtained from Kirāta-tiktaka, Atımuktaka, Vibhītaka, Nārikela, Kolā, Akshoda,

PLANTS AND PLANT LIFF

Tintidaka (Tamarind), Bellaja (Pepper), Jīraka (Cumin), साणा तु जीरके (Nigella indica), Ârdraka (Ginger), Chatra, Dhānyaka

(Coriander), Hingu (Assafoetida), Haridrā (Turmeric).

But his enumeration of the Pot-herbs —
(Sāka—মাৰান্ত ঘ্ৰম্মাই:)—is more systematic

(Sāka—गानान्धं पत्रप्रवादेः)—is more systematic and complete. Raghunath Chakravartty in his commentary

Raghunath Chakravartty in his commentary on the above Slokā, "classifies Sāka into ten groups, such as "मूलपत्रकरीराम, फलकाण्डादिरूदकम्। त्वक्षुष्यं कावकचेव, भाकं दश्विधं स्मृतम्॥" that is, ten kinds of Sākas are—roots, tips,

leaves, sprouting (harira), fruits, rhizomes (bulbs), pith, bark, flowers and mushrooms. They are illustrated thus:

- (1) Mūlam (roots)—Mūlahādeḥ (Radish and the like).
 (2) Patram (leaves)—Patolūdeh (Tricho-
- santhes dioica and others).
 (3) Kanram (anhura)—Vamsādeh (Sprouts of Bamboo and others).
- of Bamboo and others).

 (4) Ayram (tips, apices)—Vetrādeh (Calamus rotung and others).
 - (5) Phalam (fruits)—Kushmāndādeķ (Cucumber, Gourd, etc.).

- (6) Kändam (stalk)—Kadaiyādeh (Plantain rhizome etc.).
- (7) Adhirudhaham (pith)—at the head of Palmyra and Date palm.
 - (8) Tuak (bark)—Mātulunga (Citrus medica), Red Bauhinia, etc.
- (9) Pushpam (flowers)—Bauhinia, Se bania, Gourd, etc.
- (10) Kabakam (coming out of ground)—
 Mushroom.

 $Bh\bar{a}vapr_{a}k\bar{a}sa$ combines both the methods of classification of Charaka and Susruta at one (i.e., medicinal properties and dietic value). Thus:

1. Haritakyadi Yarga (The Myrobalan Group):

Under this group there are about 75 plants, only a few are noted below:

Haritakī (Terminalia chebula) with its 7 varieties, such as, Vijayā, Rohinī, Putanā, Amrita, Abhayā, Jīvantī and Chetakī, Bayedā, (Terminalia bellerica), Âmalaki (Phyllanthus emblica), Ginger, Pepper, Cumin, Assa foetida,

Fennel, Coriander, etc., etc.

Saffron, etc.

2. Karpuradi Varga (The Camphor Group): This group includes about 49 species.

Thus:—Camphor, Musk, Mallow, Santālum (with 2 varieties), Sappan u ood, Aguru, Cedrus deodara, Pinus, Nutmeg, Cloves, Cardamom and uch like fragrant spices and others Spikenard,

- 3. Guduchyadi Varga (Tinospora Group).

Under this group are mentioned about 125 species. Thus. Guduchī (Tinospora cordifolia), Tāmbul (Piper bettle), Vilva (Aegle marmelos), Gāmbhāvī (Gmelina arborea), Sālaparnī (Desmodium gangeticum), Vārttakī (Solanum indicum), Mudgaparnī (Phaseolus trilobus), Pātalā (Stereospurmum suaveolens), Ganīhārikā (Premna serratifolia), Eraņda (Ricinus communis), Karavīra (Nerium odoratum), Datura, Vāsaka (Justicia adhatoda), Bauhinia, Melia, Calamus, Gossypium, Sida with 4 varieties (अवायत्यम्), Andropogon, Asparagus, Vītis, Indigofera, Aloe, Boerhavia, Lycopodium (वरपदी), Maidenhair fern (इसपदी), Salvinia, Cleome, Lippia, etc.

4. Pushpa Varga (The Flower Group):

This group includes about 33 species—almost all the known flowers used by the Hindus—thus: the lotus (Nelumbium speciosum) with six varieties—Sveta (white), Rakta (red), Nıla (blue), Pundarık, Kohanada; Hibiscus mutabilis, Nymphaea lotus, Kalhār, Pistia stratiotes, Cerratophyllum, Jasminum with many species, eg., J. zambac, J. savibac, J. grandiflorum, J. auriculatum, etc., Michelia champaea, Mimusops, Sesbania, Nauclea, Madhablatā, Pandanus, Saraca, Pterospermum, China rose, Ocimum, Artemisia etc

1)

5 Vatadi Varga (The Bai van Group) This group includes about 42 species. Some ot them are: the Banyan, Ficus religiosa, F. glomerata, F. oppositifolia, F. vagans, Acacia, Shorea, Terminalia, Mimosa (Sponge tree), Tecoma, Soap-nut, Putranjīva, Imgudī,

Cedrela toona, Betula bhojapatra, Butea, Bombax, Dalbergia, etc , etc 6. Amradi Phalavarga (the Mango Group) This group includes about 57 species. Thus. Mango, Spondias (Hog-plum), Artocarpus, Plantain, Cocoanut, Cucumber, Melon, Areca catechu, Palmyra, Palm, Aegle marmelos, Feronia elephantum, Citrus (orange), Ebony,

(Sheu), Date-palm, Walnut, Lemon, etc., etc. 7. Dhanya Varga (The Paddy Group): This group includes about 34 species, divided into 6 sub-groups: Sāli, Vrīhi, Shushtika, Sāka,

Strychnos, Eugenia, Jujuba, Bassia latifolia, Morus indica, Punica granatum, Grape, Apple

Simbī and Kshudia. (1) Sāli-Red variety, Kalama, Pānduka and 12 others grown all over India.

(2) Vrīhi-Black variety, Pātala, Kukkutantaka, etc.

(3) Shashtika—Shashtika, Śatāpushpa, Pro-

modaka, etc. (4) Sūka (with beards, awns)—Barley, Yava (wheat) with 3 varieties—Mahāgodhūma Madhuli and Dirghagodhuma

- (5) Simbi (pulses—grains in legumes or pods), such as, Mudga, Māsha, Barbati (Dolichos sinensis), Cicer lens, Cajanus, Gram, Pisum, Lathyrus, Dolichos biflorus, Sesamum, Linum, Mustard.
- (6) Kshudra—Panicum italicum, Millet, Panicum frumentaceum, Paspalum scrobiculatum, Deodhān, Nivāra, Andropogon saccharatus, etc.

8. Saka Varga (The Pot-herb Group):

This group is divided under six heads, and includes about 70 species. The six divisions are—Leaves, Flowers, Fruits, Stem, Stalk, Moisture-born.

- (1) Leaf vegetables—This sub-group includes about 27 species Some of them are:—Chenopodium, Amaranthus, Rumex, Corchorus, Ipomoea repens (Kalambi), Portuloca, Wood sorrel, Enhydra flactuans, Marsilea, Trichosanthes (Patol), Pisum sativum, Gram, Mustard, Cassia, etc.
- (2) Flower-Sesbania, Plantain, Moringa, Bombax, Pumpkin, etc.
- (3) Fruit vegetables—Pumpkin, Cucurbita lagenaria, Bottle gourd, Cucumis, Trichosanthes, Momordica, Solanum melongana, and about 15 others.
 - (4) Stalk (Nāl) vegetables—Mustard.
- (5) Kanda (underground stalk)—about 15 speci Amorphophallus campanulatus, six

varieties of Potato, e.g., Ansthulu, Sankhulu, Yastyūlu. Pindālu, Madhvālu (honeyed) and Raktāluk; Mūlaka (Radish), Carrot, Plantain rhizome, Dioscorea, Scirpus keysoor, bulbs of Nymphoea lotus, Nelumbium, etc., etc.

- (6) Samsvedaja (Moisture-born)—Mushroom, only the white variety is recommended as vegetable, the rest are poisonous.
- 9. Taila Varga (The Oil Group)—about 14 kinds of oils are described:

Tila, Mustard, Linseed, Castor, Almond, Jocoanut, etc.

10. Ikshu Varga (The Sugar-cane Group)—
13 varieties are described. They are—Poundraka, Vīruka, Vamsaka, Sataporaka, Kāntāra,
Tāpasekshu, Kāndekshu, Sūchipatraka, Naipāla,
Dīrghapatra, Nīlapora, Monogupta and Košaka.

SECTION VIII

PLANTS AND EVOLUTION

The ancients in India believed that plants had preceded animals, particularly man in the scale of creation, a fact confirmed by the evidences of modern Geology.

The first writer who gives a definite pronouncement upon the point is $Uddalaka^1$ who holds:

"The earth is the source (rasa) of all these elements (एवा মুরানান্); water is the source of the earth; again the essence of water is embodied in plants (aushadhayo—of herbs), and man represents the essence of plants and so forth."

Next comes Varuna² according to whom the elements are five—Ether, Air, Fire, Water and Earth. "Of these, in order of time Ether (ākāsa) springs from Brahman; Air from Ether; Fire from Air; Water from Fire; Earth from Water; herbs from Earth: food from herbs; seed from food; and man from seed — such is the evolution from the Supreme Brahman to Man.

¹ Chhāndogya Upanishad, Adhyāya I, Khanda I, 2.

² Taittiriya Upamehad II 1- Barus, IX p 145

PLANTS AND INOLUTION

Yājñavalkya i maintains the above view in more details. Thus.

" Earth is the scurce of this creationmovable and immovable, for it supplies them

with the constituents of their body; and water again is the root cause of earth for earth is begotten of water: the essence of water is embodied in plants such as grasses, creepers and the rest, flowers represent the essence of

plants, and the essence of flowers are fruits,

such as paddy, wheat and the rest." An astonishingly modern idea of Evolution

occurs in the following dialogue of Buddha. "There come a time when the visible

universe passes away, and consequently beings are reborn elsewhere in the nebular sphere.

This is duly succeeded by a time when the world begins to develop anew. All is then water, and enveloped in darkness, a darkness that blinds. Those beings, falling from radiant worlds are reborn within the formed universe, made of

consciousness, sustained by joy, floating in space, and shining in glory. The formed universe, the juicy earth (rusa pathavi) 'emerges from the waters like a scum of milk or ghee, odorous and sweet' Having come in contact with it, feasting thereon, those beings become solidified, and lose thereby part of their luminance. Thus

the Sun, the Moon and the Stars and Planets

¹ Brihadāranyaka Upanishad, 46 l

130

the low to the higher grade.

Let us sum up the chapter with an interesting anecdote from the Rāmāyaṇa² which very powerfully bears upon the precedence of plants to animals. The story is summarised below.

Once an owl and a vulture quarrelled over

the possession of a nest in a certain tree each

hardened, it loses its flavour and sweet taste, but vegetation first of low, then higher grade evolves. Man descends at length from his heavenly ancestors—from the vital Sun or the reflective Moon."

In this quotation 1 we notice a distinct mention of the evolution of plants in themselves from

laying an equally emphatic claim to its ownership. Unable to settle the dispute themselves they preferred an appeal to Rāma. On being asked how long they had been there the vulture replied that he had been there since man began to inhabit the earth (मनुष्य: परितोबदा). The owl replied that he had been there since the earth became decorated with plants (पादपेषपशोभिता). In consultation with his ministers Rāma decided in favour of the owl on the score of the prior appearance of plants on earth.

SECTION 1X

MISCELLANEOUS APPLICATION OF THE SCIENCE

1. As a means of Economic Predictions

A chapter in the $Brihat\ Sambit\tilde{a}$ is devoted towards the subject.

"फलकुसुम-सम्प्रहिषं वनस्पतीनां विकोक्य विद्वेयम्। सलभत्वं द्रव्यानां निष्यत्तिश्वापि ग्रस्थानाम्॥"

"One can infer the cheapness (स्तामत्वम्) of commodities by me ins of looking at the abundance of the growth and development of flowers and fruits in certain trees."

One can infer the cheapness (स्त्रस्त्रम्)—
"Of Kalama Sālı (paddy) from the abundant

growth of flowers and fruits of Sāla (Shorea robusta), of red Sāli from red Aśoka (Saraca indica), of Pānduka (a variety of Sāli paddy) from Dugdhihā (Asclepias sp.) and of Sukaruha

(paddy) from blue Aśoka (নীৰামীকীন)." 2.

'Of Yavaka (a variety of Śāli) from Nyagrodha (Ficus bengalensis), of Śhashtika from Tinduha (Diospyros melanoxylon), and of all Cereals (মুক্তীয়ায়ানাম) from Aśwattha (Ficus religiosa)." 3.

Of Tilam (Sesamum indicum and Māsha (Phaseolus mungo var. Roxburghii) from Jambu (Eugenia jambolana); of Priyangu (Panick) from Sirīsha (Mimosa sirisa), of Wheat from Madhuka (Bassia latifolia), and Barley from Suptaparna (Echites scholaris)."

"Of Gossypium (क्योंसन्) from the abundance of Atimuktuka (Aganosma caryophyllata) and Kunda (Jasminum sp): of Sarshapa (mustard) from Asana (Terminalia tomentosa); Kulattha (Dolichos biflorus) from Vadarī (Zizyphus jujuba); and Mudga (Phaseolus radiatus) from Karaāja (Galedupa arborea or Robinia mistis)."

5.

"Atasī (linseed) from the flowers of Vetasa (Calamus rotung), Kodrava (Paspalum frumentaceum) from the flowers of Palāša (Butea frondosa); Šankha (Mother pearl), Muhta (pearl) and Silver from the Tilaka (Sesamum indicum) and Sana (?) from Ingudī (Balanites Roxburghii)."

"Elephants from Hastikarna (Ricinus communis) and Horses from Assakarna (a variety of Shorea robusta); Kine from Pātalā (Bignonia) and Coats and Lambs from Plantain" 7.

"Gold from the flowers of Champala (Michelia champaka), cheapness (भगत्) of Bidruma (coral) from Bandhujīva (Pentapetes phænicea or Ixora coccinea). Bajram (a kind of gem) from the overgrowth (उद्या of Kuruvaka

(Barleria cristata purple variety) and V a

"One can infer the cheapness of Moultun

S

dūryyam from Nandikārartta (Tabernaemontana

coronaria)."

(pearls) from the Sindhuvāru (Vitex trifolia) (longevity and prosperity) of Artists (有版句) from the Kushumbhu (Safflower); and those of the Rājā (king) from the red lotus and of Minister from the blue lotus "9.

"(Prosperity of) a Sreshthu (trader) is to be

inferred from the Suvarnapushpa (Cassia fistula), of the Brāhmanas from the lotus; of the Purohita

(king's spiritual preceptor) from the Nymphaea alba (white lily); of the Senāpati (commanderin-chief) from the Saugandhika (a variety of the lotus), and increase of gold (wealth) from the Arha (Calotropis gigantea)."

10.

"(General) well-being is indicated by the Mango; danger (fear) by the Bhallātaha (Seme-

carpus anacardium); recovery (from illness) by the Pīlu (Salvadora indica or persica); famine by the overgrowth of Khadira (Acacia catechu), and Samī (Mimosa suma); and good (शोभना) rain by the Arjuna (Terminalia arjuna) " 11.

"Abundance of crop (स्थिचम) by the flowers

"Abundance of crop (মুখিল্ম) by the flowers of Pichumanda (Melia azadirachta) and Nāga-lusuma (Mesua ferrea), good air (climate) by Kapittham (Feronia elephantum); fear of draught

(प्रकृष्ट्रभयम्) by Nichula (Eugenia acutangula). and

epidemic (fear of disease) by Kutaµu (Holarrhena antidysenterica) " 12.

"Ihshu (sugarcane) by the flowers of $D\bar{u}rv\bar{u}$ (Agrostis linearis) and $Ku\acute{s}u$ (Darva—Poa cynosuroides), fear of fire by $Kovid\bar{u}ru$ (Bauhinia acuminata); and the increase of prostitutes by the overgrowth of $Sy\bar{u}mu$ -lat \bar{u} (Ichnocarpus frutescens)."

Signs of coming rains (दृष्टिलचण्म्) :

"When Vrikshus (trees), Gulmus (shrubs and herbs) and Latās (ereepers), become full of snigdha (graceful) and nishchchhidra (entire, untern) leaves, (it is sure) that rains are coming; and when the plants (trees, etc.), bear leaves that are dry, ungraceful (表表:), torn with many holes (極意:), it predicts scarcity of water, i.e., of coming drought."

तथा च पराशर:-

"श्रक्षिट्रपताः सुस्तिग्धाः फसपुष्पसमन्विताः। निर्द्दिषन्ति ग्रुमं वृत्वा विपरीतं विगर्हिताः॥"

We have in Bengal a common saying of a similar import:

"Abundance of mango forebodes an abundance of paddy crop; and Tamarind—flood."

2. As a means of ascertaining the presence of water in a dreary region:

This chapter only gives a brief representation of the art through some select verses quoted from Brihat Samhitā where an elaborate chapter containing some 115 slokas, is devoted to the topic. Thus:

Just as there are veins and arteries in the human system (carrying blood) up and down, so there are passages (fagge) within the bowels of the earth at different depths carrying water.". 1.

"If one finds a *Vetasa* plant (Calamus rotung) in a waterless tract, one is sure to find water by digging the ground at a distance of 3 cubits to the west of it half a *purusha* below the earth." (one *purusha* is equal to 120 angulas—about 7 ft.).

"If you find a Jambu (Blackberry) tree in such a land dig a hole 2 purushas deep, 3 cubits to the north of it, and you will find water running in a vein eastward."

"If there be ant-hills close by to the east of the said Jambu tree you will surely find sweet water in a pit dug 2 purushus deep, 3 cubits to the south of it."

9.

Trans ated for the first time by the auth r Chap 58 Vol II pp 706-742.

If a l lumbar: (Figure glomerit:) tree is seen you are sure to find sweet water flowing in a vein, in a pit dug $2\frac{1}{2}$ purushas deep, 3 cubits to the west of it."

"If an ant-hill is found to the north of an Arjuna (Terminalia arjuna) tree, water will be found there $3\frac{1}{2}$ purushas under the earth, at a distance of 3 cubits to the west of that tree." 12.

"If Nugundi (Vitex trifolia) tree is found with an ant-hill, one will find tasteful water in a pit 2 purushas deep, 3 cubits towards the south."

"If a Vadan (Zizyphus jujuba) and a Palāśatree (Butea frondosa) are found together you will find good water, 3 purushas under the earth, 3 cubits towards the west of the former." 17.

"When a Vilia (Aegle marmelos) and an Udumbara (Ficus glomerata) tree are found growing together, you will get water $3\frac{1}{2}$ purushas under the surface of the earth at a distance of 3 cubits from the trees."

"Where to the north-east of a Konidara (Bauhinia acuminata) tree is found a white ant-hill with Danva (grass) over it, water will be found between them $5\frac{1}{2}$ purushas under the ground" 27.

"If a frog is detected living beneath a tree one will surely get water $4\frac{1}{2}$ purushus under the ground towards the north of that tree 31

APPLICATION OF THE SCIENCE 13 'If an ant-hill inhabited by a serpent is found to the north of a Madhuka (Bassia latifolia) tree, you will get water at a distance of 5 cubits from the tree, 72 purushas under the ground." 35. "If you find a Palmyra tree or a Cocoanut tree with ant-hills, you will have a vein of good water flowing at a distance of ô cubits to the west of either of the above trees 4 purushas under the ground." 40. "There is water by the trees that are sappy, have long branches, or very dwarfish, or very spreading. And there will be no water near the trees that are sickly, have unhealthy leaves, and vapid." 49. "Water will be found 41 purushas below the ground at a distance of three cubits to the north of the following trees surrounded by anthills: Tilaka, Amiātaka, Varunaka, Bhallātaka, Vilva, Tinduka, Ankola, Pindara, Sirisa, Arjuna, Parushaka, Vañjula and Atıbalā." 50 & 51. "If a thorny tree (e g. Khadira) is found in the midst of thornless ones (like Palāśa), or a thornless tree is found in the midst of thorny ones, water will be found 3 purushas under the ground at a distance of 3 cubits to the west of

"If a Kantakārika (Solanum sp.) plant is found without thorns and with white flowers,

such a tree."

53.

water will surely be found under it at a depth of 31 purushas." 57. "The region where trees, shrubs and creepers

are graceful possessing leaves that are untorn (entire) there are veins of water 3 purushas below the ground. Or where there are Sthalapadma, Gokshura, Usira, Kula with Gundra,

Kāśa, Kuśa, Nālik or Nāla (all grasses); or where there are Kharjjūra, Jambu, Arjuna, Vetasa, or trees, shrubs or herbs with milky juice, or Chhatrā, Hāstikarņa, Nāgakešara, Padma,

Nípa, Naktamāla with Sindhubāra or Vibhitaka, Madayantikā. there will be found water 3 purushas below, even if it be on the mountain upon another mountain, i.e., on a very high

ground." 100, 101 & 102. "Where there are Śāka, Aśwakarna, Arjuna, Vilvasarija, Šriparnī, Arishta, Dhaba, Šimšapā with leaves torn (i.e., unhealthy), and where

the trees, shrubs and creepers look ungraceful. water is to be inferred to be off from that locality." The art of ascertaining the presence of water

through its vegetable accessories reached a great perfection in India. It became a matter of common knowledge as it would be evident from the following anecdote summarised from a Jataka story 1

Once upon a time the Bodinsattva born as a merchant, set out on a mercantile adventure. While passing through a wilderness he lost his wood and water. In his eager search for water he "ranged to and fro, while it was still early and cool until he came on a clump of Kuśa grass. "This grass," thought he, "can only have grown up here, thanks to the presence of water underneath." He caused a hole to be dug and "up rose the water in the hole till it was as high as a palm tree."

SECTION X

CONCLUDING REMARKS

Thus the result of our enquiry is that various observations of plant-life which are of scientific value, are contained in different Indian works and traditions. We cannot but appreciate the keenness of spirit shown. Unfortunately this spirit was not rigorously separated from fanciful superstitions and mythmaking, with the result that the science of plant and plant-life could not make any further advance as a science. It degenerated into an art, and from art into an artifice. The soul fled and only the body remains.

HEREDILL

The principle of Heredity plays an important part in modern Biology. Darwin with his

theory of Pangenesis, and Wiesmann with his theory of Germ-plusm and the neo-Darwinians and the neo-Wiesmannians with their improvements have not yet been able to come to any all-round satisfactory solution of the problem. And it is interesting to see what the ancient Biologists, coming at least two thousand years before Darwin and Wiesmann thought about this important problem. As plant life constitutes one of the principal themes of Biology we insert below Dr Seal's Chapter¹ on Heredity in its entirety with full references of the text from which he derives his information:

"Transmission of specific characters—what parental characters are transmitted to offspring.—The question is raised in Charaka² (and earlier still in the Brāhmanas) how specific characters are transmitted—why the offspring is of the same species as the parental organism, say, the human or bovine species, the equine species, or the

Positive Science of the Ancient Hindus, Section 9, pp 233-239 (1915).

(or the seed in the case of a plant) represents in miniature every organ of the parent organism. and contains in potentia the whole organism that is developed out of it (शरीरधालाला शक्तभूत:

Sankari similarly states that the sperm cell

बङ्गादङ्गात् सन्धवति). But if this is so, why are not congenital deformities of the parent, or consutational diseases contracted in later life, invariably

inherited? Congenital blindness, deafness, dumbness, stammering, lameness, or deformity of the spinal column or of the bony framework, or dwarfish stature, or constitutional diseases like madness, leprosy, or skin diseases in the

parent, do not necessarily produce corresponding deformities or infirmities in the offspring. It cannot therefore be that the fertilised ovum represents in miniature every organ or tissue of the parental organism. The solution of this difficulty Charaka 2 ascribes to Atreya. The

fertilised ovum, it is true, is composed of elements which arise from the whole parental organism (समुदायात्मक, समुदायप्रभव), but it is not the

Sankara on Bribadārauyaka ² Charaka, Sarīrasthāna, III, 22-26, English Translation, Fasc 23 p. 780, Fasc 24, Sec. 29, p 733

"" Verily in the seed from which the body springs, there are parti

cular portions from which particular limbs grow. When a particular

portion of the seed, therefore, is burnt up or consumed, the particular

hmb which would have grown out of it becomes deformed. No

deformities again, occur if no portion of the seed becomes burnt up

or consumed . Ab nat (h Kayı atna's trans'ation of the ex

developed organs of the parents, with their idiosyncracies or acquired characters, that determine or contribute the elements of the sperm-cell (or seed). The parental Vija (seed, germ-plasm), contains the whole parental organism in miniature (or in potentia), but it is independent of the parents' developed organs, and is not necessarily affected by their idiosyncracies or deformities. In fact, the parental $\mathcal{V}_{\bar{l}ja}$ (seed. germ-plasm) is an organic whole independent of the developed parental body and its organs In the parental Vija an element representing a particular organ or tissue may happen (for this is accidental, देव) to be defective or undeveloped, or otherwise abnormally characterised, and in this case the corresponding organ or tissue of the offspring will be similarly characterised. When constitutional diseases. acquired in later life, are found to be inherited. $\hat{A}treya$ would suppose that the Vija of the parent has been affected, and this would explain the fact of the inheritance. In the case of leprosy, for example, it is transmitted to the offspring only when the germ-plasm (the Vija or the fertilised ovum) is infected with the virus of the disease by reason of the leprosy of the parent.

N. B.—The seventh tissue (the Sukradharā kalu sperm bearing or reproductive) contains

combination and characters of these constituent elements of the parental $\Gamma_{\bar{l}/a}$ in the reproductive tissue that determine the physiological characters and predisposition of the offspring We may call this $\hat{A}treya$'s germ plasm theory. for it is an advance on the conception of

"gemmules" and "ids," but in Atreya's version the "germ-plasm" is not only representative of the "somatic tissues." but also generates and is

the parental $F_{ij\sigma}$, which is a minute organism (ससुदायात्मक) deriving its elements from the parental organs, but distinct from the latter, and independent of their peculiarities, and it is the

generated by the latter. This mutual interaction of the "germ-plasm" and the "somatic tissues" is a distinctive feature of Atreya's hypothesis, the value of which will be differently estimated by different schools of biologists.

I may also add that the continued identity of the "germ-plasm" (क्रेज) from generation to generation, though it follows as a corollary from this doctrine of a distinct reproductive tissue, even when conceived to be affected by somatic

"The physician should know that like fat (Sarpi) in the milk, or sugar in the expressed juice of sugar cane, the (seat of semen) is coextensive with the whole organism of a man (or animal)

The semen under exhibits to a comes down fall parts of be body owing

processes, as Atreya and Charaka conceive it

'Sokradhaiā kāla—extends throughout the entire body of all living creatures" 20

to be, is nowhere expressly deduced. On the other hand, Atreya and Charaka emphasise the influence of abundant or defective nutrition (see English translation 16, 17, pp 774, 725), and of the constituents of the food, etc., on the characters of the Vija in the reproductive tissue, especially as regards the sexual character, the stature, and the colour-pigment ($\mathbf{q}\mathbf{q}$) of the offspring. But though the influence of nutrition on the Vija is thus freely admitted in a general way, it is expressly stated that the peculiar characters or idiosyncracies of the elements that combine to form the Vija must be regarded as a matter of chance ($\mathbf{\bar{q}}$), in other words, the truly congenital variations are accidental."

BOTANY AND SCIENCE OF MEDICINE

SECTION I

GENERAL OBSERVATIONS

The connection between the study of plantlife and the science of medicine has been intimate

throughout the whole course of the genesis, development, and the culmination of the latter in India-from its genesis traced in the verses of the Rig Veda down to its culmination in the monumental treatises of Churaka and Suśruta. The application of plants as medicines as recorded in both these works are minute, exhaustive and extensive, and it is needless to reproduce the thing in detail. Here the study of the individual properties of plants, their application in diseases as means of cure, the collection of plants, the selections of plants, the preparation of drugs out of them, the selection of soils for plants to grow upon are excellently prescribed. No fewer than 26 forms of medicine derived from plants are mentioned. Instead of wasting space over what is common knowledge we turn to the more interesting task of tracing the historical development of the science of Medicine in Ancient India beginning from the earliest times down to its virtual stagnation

SECTION II

BEGINNINGS OF MEDICAL SCIENCE

The Vedic texts reveal to us the science in its rudimentary stage, while *Charaka* and *Suśruta* exhibit it in its full-fledged development, its practical consummation. We have no materials

sufficient to show us in detail the processes through which the transition from the rudimentary stage of the science of which we get a picture in the Atharva Veda to the stage of its final development which we see in the Charala and Suśruta took place, and we are left to vague conjectures and inferences. Only a hypothetical attempt based on warrantable evidences, can be made. Whatever may be the stages of its development, it is clear beyond all doubt that this useful science has not undergone any further progress since the time of Charaka and Suśruta. The later contribution on the subject, rich as it is in quantity, does not represent any improvement in quality, nor a single step of advance in the theoretical aspect of the science as science, and our attempt will necessarily be confined to a description of the direction taken by the science from its inception to its fullest development

The first medical utterance of man is to be found in a text of the Rig Veda namely, in the Aushadhi Sūkta of the 10th Mandala which gives us a description in detail of the variety of the use to which plants used to be put. One hundred and seven applications are mentioned, but the number must not be taken literally but as a poetic statement of plurality. Here is the Sūkta.¹

- "Medicinal plants and herbs 2—Bhisaj—the physician, son of Atharva.
- 1. I think of the hundred and seven applications of the brown-tinted plants, which are ancient, being generated for the gods before the three ages.
- 2. Mother (of mankind) a hundred are your applications, a thousandfold is your growth; to you who fulfil a hundred functions make this my people free from disease.
- 3 Rejoice, plants, bearing abundant flowers and fruits triumphing together (over disease) like (victorious) horses, sprouting forth, bearing (men safe) beyond disease.
- 4. "Plants"! thus I hail you, the divine mother (of mankind). I will give to thee, Oh physician, a horse, a cow, a garment—yea, even myself.

dwelling is established in the *Palāša*, you are assuredly the distributors of cattle, inasmuch as you bestow them on the physician (*Mahīdhara* says (X1I, 79) the vessels in which the offerings

Your abode is in the Amoattha your

are presented are made of the wood of these two].

6. Where, plants, you are congregated like princes (assembled) in battle, there the sage is designated a physician, these the destroyer of

evil spirits, the extirpator of disease.

7. The Aśvāvatī, the Somavatī, the Ūrjayantī the Udojasa (are the four principal plants)—

all these plants I praise for the purpose of over-

coming this disease.

he seizer of life

8. The virtues of the plants which are desirous of bestowing wealth issue from them, man, (towards) the body like cattle from the pen.

9. Verily *Ishkriti* is your mother, therefore are you (also) *Nishikritis*; you are flying streams; if a (man) is ill you cure him.

10. The universal all-pervading plants assail (diseases) as a thief (attacks) a cowshed; they drive out whatever infirmity of body there

may be.

11. As soon as I take these plants in my hand making (the sick man) strong, the soul of the malady perishes before (their application) as (life is driven away from the presence) of

12 From him Oh plants in whom you

ી

ereep from himb to limb, from joint to joint you drive away diseases like a mighty (prince stationed in the midst of his host.

13 Fly forth, sickness, with the jay, with the blue jay, with the velocity of the wind, perish

along with the iguana

14. Let each of you, plants, go to the other, approach the one (to the vicinity) of the other; thus being all mutually joined together.

attend to this my speech.

15. Whether bearing fruit or barren, whether flowering or flowerless, may they, the progeny of *Brihasputī*, liberate us from sin.

progeny of Brihasputī, liberate us from sin.
16. May they liberate us from the sin produced by curse, from the sin cursed by Varuna,

from the fetters of Yama, from all guilts caused by the gods.

17. The plants, falling from heaven, said,

'The man, whom living we pervade, will not perish.'

18. The plants which have the Soma for their king, and are numerous and all-seeing, of them thou (Oh! Soma-plant) art the best; be

very bountiful to the affectionate heart.

19 Plants, which have the Somu for your king, and who are scattered over the earth, the offspring of Bilhaspatī, give vigour to this (infirm body)

20 Let not the digger hurt you nor the

bipeds and quadrupeds be free from diseases.

21. Both the plants that hear (this prayer), and those which are removed far off, all coming together, give vigour to the (infirm body).

22 All the plants together with Soma their king, declare, 'We save him, O king, to whom the Brāhman administers us'
23. Thou (Soma) art the best of the plants, to thee (all) trees are prostrate; may be be pros-

trate to us, who attacks us."

This hymn together with the one following it, namely, the hymn addressed to a plant used against a rival wife, and the Sukta XVIII of Mandala VII constitutes practically speaking the whole of the science or art, or both science

and art, of Medicine as revealed in the Rig Veda. Here is the hymn to the plant against a rival wife.

"1. I dig up the most potent medicinal creeper

by which (a wife) destroys a rival wife, by which she secures to herself her husband.

2. O (plant), with upturned leaves (the creeper referred to in the hymn is the Patha)

auspicious, sent by the gods, powerful, remove my rival and make my husband my alone. 3. Excellent (plant), may I too be excellent amongst the excellent and may she who is my

rival be vile amongst the viles

(woman) takes pleasure in that person, may we remove the other rival wife to a distance 5. I am triumphing, thou art triumphant. we too being powerful will triumph over my rival

6.

I make the triumphant (herb) my pillow, I upport thee with that more triumphant (pillow), let thy mind hasten to me as a cow to her calf, let it speed on its way like water"

VII: "2. May the brilliant Agns counteract that poison which is generated in manifold knots (of trees and the like) 3. The poison that is in Sālmalī tree

And thus runs the verse of Sūkta 18, Mandala

(Bombax malabaricum), in rivers, or which is generated from plants, may the Universal gods remove from hence; let not the tortuous (snake) recognise me by the sound of my footsteps." These three hymns taken together give us

in a nutshell a world of ideas—a whole science in a few words. We get here the names of certain plants with Soma, the king of plants, at their head, and Aswavatī, Somavatī, Urjayantī Udolasha, and possibly also Aśwattha and (Figus religiosa) and Palāśa (Butea frondosa)

as powerful agencies of cure against diseases. Innumerable applications of plants are referred to though not definitely named We are told natural and supernatural, against bodily infirmities as well as against curses and the like. We also come to learn that plants could be used by themselves as well as in association with incantations and prayers. The genesis of the whole body of medicine is given as Divine, and the nature of the cure is clearly characterised as radical, permanent and comprehensive. We are given in brief either the condensation, a

scientifically nice epitome, or the germ of the

PLANTS AND FLANTILL'L

that plants used to be applied as medicines, both individually and collectively, against diseases

156

Science of Medicine, or the art of care, of demonology and classification of plants or Botany at once. Behind the wealth of poetry we get some solid facts of scientific importance. The whole thing has the air of a summary distinctly presupposing more elaborate statements, a knowledge of details. There is no vagueness, but freshness of the original revealed to us in an unmistakable language. Where are the details gone? They are either, to all intents and purposes.

generation till at last they came to be synoptically recorded in some treatise; and the Vedic texts quoted may be the synopsis of a synopsis.

But we have a harvest of details bearing on the subject of medicinal plants their utilities,

their classifications the diseases against which

lost or they existed in popular memory and were handed down by tradition from generation to

1

they were applied, the association in which they were to be applied and the rest. In the text of the Atharva Vedo.

These details seem to be an elaboration of what we get in a synoptical form in the three hymns of the Rig Veda just quoted. There are points of similarity between the two; nay, there is essential identity. The latter seems to be an only elaborate edition, a popular commentary of the former. How are we to explain this? Either the details of the Athorro Veda must be a development from and a lengthy explanation of the things we get in the Rik or the Rik hymns give us a summary of the things so universally known.

SECTION III

MALADIES—THEIR CLASSIFICATIONS AND REMEDIES

In the Rig Vedic hymn already quoted the medicinal use of plants together with mention of some plants by name are given, classifications of plants are indicated, and the diseases, supernatural and natural, are referred to as being within the province of perfect and radical cure through the application of plants as drugs. For the sake of convenience and nicety, we now classify the medicinal plants of the Atharva Veda under the following heads:

- 1 Those that cure physical maladies brought about by purely physical agencies (*Kāyachikitsā*).
- 2. ,, ,. ., supernatural maladies brought about by supernatural agencies ($Bh\bar{u}ta-vidy\bar{a}$).
- 3. ,, help in the procreation and protection of children (Kaumāravritya)
- 4 ,, ,, are used for curing minor and serious wounds, etc. (Salyavidya)

Miscellaneous.

1. Physical Maladies The medicinal plants that were used as

drugs against diseases brought about by physical gencies are mentioned in the following hymns

of the Atharva Veda: 1

Bk I. 2—against injury and diseases.

" " 3—obstruction of urine.

" " 23 and 24—against white leprosy. Bk. II. 25—against abortion. Bk. V 4—against fever and other maladies.

The physical maladies against which cure is provided are leprosy, fever, obstruction of urine, head-disease, evil of the eye, abortion and injury

Bk. XIX 39-against disease takman (fever)

head-disease, evil of the eye, abortion and injury and diseases in general Some of the several medicinal plants that are mentioned in the text have been identified with their modern represen-

tatives These are Reeds Haridra Kushtha,

IA ITANTS AND PLANTILET

application of the drugs is nicely described. From the hymns containing cure against natural diseases, it is clear beyond all doubt, that the Science of medicine as revealed in the Atharva

Chiliapara etc The genesis of the diseases in some cases are given and the method of the

Vedic texts is far from being in a state of infancy. It presupposes a good deal of experiments and observation, and seems to be based on a wide generalisation.

"We know the reed's father, Parijanya the

much-nourishing; and we know well its mother, the earth of many aspects."—Plant identified is reed. (I. 2. 1.)

"Night-born art thou, O herb, O dark,

black, dusky one; O colourer, do thou colour this leprous spot and what is pale." (I 23.1)
"Ot the bone-born leprous spot, and of

the body-born that is in the skin, of that made by the spoiler—by incantation have I made the white mark disappear." (I. 23, 4.)

"The Asura-woman first made this remedy

for leprous spot, this effacer of leprous spot; it has made the leprous spot disappear, has made this skin uniform." (I 24 2.)

Plant identified is $Harrdr\bar{u}$ —Circuma longa

"The blood-drinking wizard, and whose wants to take away fatness, the embryo-eating kanva do thou make disappear, O spotted leaf and overpower" (II 25 3)

Plants identified are.

- 1. Māshaparņī-Glycine debilis.
- 2. Lakshman—Having upon its leaves red spots.

Putrajanī—Bhābaprakāśa, I. 208

Putrakandā—Rājunighantu, VII. 114.

Putradā—a bulbous plant.

- 3. It is a leguminous plant identified by U. C. Duta as Uraria lagopodioides. Dec.
- "On an eagle-bearing mountain, born from the snowy one; they go to it with riches, having heard of it, for they know the effacer of fever." (V. 4. 2.)
- "The $A\hat{s}wattha$, the seat of the gods in the third heaven from here; there the gods won the Kushtha, the sight of immortality." (V. 4. 3.)
- "Born in the north from the snowy mountain, thou art conducted to people in the eastern quarter; there they have shared out the highest names of the Kushtha." (V. 4. 8.)
- "Head-diseases, attack, evil of the eyes, of the body—all that may Kushtha relieve, verily a divine virility." (V. 4. 10.)

Plant identified is Kushtha—Costus speciosus or arabicus

Supernatural Maladies

Bk II 7 against curses and cursers

Bk. IV. 17-against various evils.

- ,, 18-against witchcraft.
- .. 20- to discover sorcerers.
- , 37—against various superhuman foes (against possession by evil spirits).

Bk. V 14—against witchcraft

" 15—against exorcism.

VI. 85-for relief from Yaksa.

VIII. 5. 2—against witchcraft, etc

., 7—to the plants for some one's restoration to health.

As the title indicates remedies of supernatural diseases were exclusively directed against supernatural agencies, such as demons, Yakshas, ghosts, curse of gods or the like. : lants used as drugs were sometimes applied by themselves, and sometimes in association with incantations, invocations, and magical formulæ. A pronounced characteristic of the Eastern system of medicine is that it provides for the cure against the diseases of the spirit, which the West has left to the region of incurability, where in the language of Macbeth's Physician—"the patient must administer to himself." Of all the supernatural diseases witchcraft seems to be the most

prevalent one, and a very large number of plants are prescribed as remedies against it. While giving remedies against this disease m detail, the hymns of the Atharva Veda coming under this head throw a lurid light upon the contemporary state of customs and beliefs—a state of civilisation characterised by ferocity, superstition, envy and malice. Besides witch-craft may be mentioned obsession by Yaksha, Demon, Apsarā, Gandharva, sorcery, curses, ghost, etc. All the plants prescribed are not, unfortunately, named; only a few and a very few have been identified with their modern representatives.

The application of the supernatural remedies in association with natural ones is a prominent feature of the ancient Medical Science, and the following quotations cursorily taken from the hymns will suffice to illustrate our remark:

"Let the curse go to the cursers; our [part] is along with him that is friendly; of the eye-conjurer, the unfriendly, we crush in the ribs." (II. 7.5.)

Plant identified is $Durv\bar{a}$ (Panicum daetylon).

"The truly-conquering, the curse-repelling, the overcoming, the reverted one—all the herbs have I called together saying—may they save us from this." (IV. 17. 2.)

"Death by thirst, death by hunger, likewise

164 I ANTS AND I LANT LIFE

wipe off all that. (IV. 17.7)

rhombifolia), and $Ap\bar{q}m\bar{u}rga$ (Achyranthes aspera)

"O thou of thousand abodes, do thou make them lie crestless, neckless: take back the witchcraft to him that made it, like a sweet-

defea at dice through thee C off wiper we

Plants are-Sahadevī (Sida cordifolia and

heart to a lover." (IV. 18. 4.)

"I. with this herb, have spoiled all witch crafts—what one they have made in the field, what in the kine, or what in thy men." (IV. 18 5.).

"Whichever flies through the atmosphere,

and whichever creeps across the sky; whichever thinks the earth a refuge that Piśācha do thou shew forth." (IV. 20.9.)

Plant is—Sadampushpā—ever-flowering.

"By thee do we expel the Apsarases, the Gandharvas; O goat-horned one, drive the demon; make all disappear by thy smell."

(IV. 37. 2.)

"Where are the Aśwatthas, the Nyagrodhas, great trees, with crests—thither go away, ye Apsarases; you have been recognised" (Popular belief is still prevalent that these plants are haunted by ghosts, etc.). (IV. 37. 4.)

haunted by ghosts, etc.). (IV. 37. 4.)

"Hither hath come this mighty one of the herbs, of the plants; let the goat-horned arā-

takī, the sharp-horned, push out." (IV 37.6.)
Plant is Ajāsringī Odina pinnata

The ovala-eating Gan Hairas Avala is Blyxa octandra (a grass-like marsh plant). (IV. 37.8 & 9)

- "An eagle discovered thee: a hog dug thee with his snout; seek thou to injure. O herb, him that seeks to injure; smite down the witch-craft-maker" (V. 14. 1.)
- "Be the witchcrafts for the witchcraft-maker, the curse for him that curses; like an easy chariot let the witchcraft roll back to the witchcraft-maker" (V 14.5.)
- "The Varana, this divine forest-tree shall ward off the Yaksha, that has entered this man—that have the gods warded off "(VI 85 1.)

Plant is Varana—Crataiva Roxburghi

- "Thou art the chief of herbs, as the ox of moving creatures, as the tiger of wild beasts; whom we sought, him have we found, a watcher near at hand." (VIII. 5 11.)
- "Those that are brown, and that are bright, the red and the spotted, the swarthy, the black herbs—all do we address." (VIII. 7. 1.)
- "Food of fire, embryo of the waters, they tha grow up renewed, fixed, thousand-named—be they remedial (when) brought." (VIII. 7. S.)
- "Wrapped in $Avak\bar{a}$, water-nurtured, let the herbs, sharp-horned, thrust away difficulty." (VIII. 7. 9)
- (An amulet made of splinters of ten kinds of trees against all diseases,)

> Plants that Help in the Proceeding and Protection of Children

Here we are to examine the art of procreation and preservation of children by means of plants. Side by side with procreation had to be considered the hindrances, natural and supernatural, and consequently the requisite remedies. Plants constitute a substantial section of the remedies used for the purpose.

The plants used for these purposes are mentioned in the following hymns:

Bk II 25-against abortion with a plant.

Bk. III. 23—for fecundity—"to procure the conception of male offspring."

Bk. VIII. 6—To guard a pregnant woman from demons

The following quotations cursorily taken from the text will suffice to show both the nature of the remedy and the conception of the disease, both being comprehensive, radical and thorough:

"The blood-drinking wizard, and whose wants to take away fatness, the embryo-eating kanva do thou make disappear, O spotted-leaf, and overpower." (II 25.3).

"The plants of which heaven has been the father, earth the mother, ocean the root—let those herbs of the gods favour thee, in order to acquisition of a son" (III 23 6)

The two pouse finder which thy mother rubbed up for thee when boin—for them let not the ill-named one be greedy, the almsa nor the vatsapa (VIII 6 1)

"Whoever makes this woman one having a dead child, or a miscarriage, him, O herb, do thou make disappear, lustful for her, slippery." (VIII. 6.9)

(An amulet of white and yellow mustard plants.)

4. Plants used for curing Wounds, etc.

It is abundantly evident from the hymns of the Atharva Veda dealing with medicines for wounds, etc., that the surgical treatment, too, was considerably developed in Ancient India. The hymns are very few in number, but they are enough to show us that the first surgeons of India, for so we must call them, knew a good deal of anatomy, displayed a good deal of skill, in accurately examining the nature of the cases and in prescribing radical remedies against them. They also appear to be acquainted with a process of classification of plants. The following quotations typically selected will illustrate our remark.

To heal serious wounds with a herb:

"What of thee is torn, what of thee is inflamed is crushed in thyself may Dhātar

excellently put that together again, joint with joint "(boiled Lākshā water—perhaps it is a product of Arundhatī plant). (IV. 12 2.)

"Let thy marrow come together with marnow, and thy joint together with joint; together let what of thy flesh has fallen apart, together let thy bone grow over" (IV. 12.3.)

"Let marrow be put together with marrow; let skin grow with skin; let thy blood, bone grow, let flesh grow with flesh." (IV. 12 4.)

"If by a staff, if by an arrow, or if by flame a scre is made, of that thou art relief, relieve thou this man." (V. 5 4.)

"Out of the excellent Plaksha (Ficus infectoria) thou arisest, out of the Aśwattha (Ficus religiosa), the Khadıra (Acacıa catechu), the Dhara (Anogeissus latifolia), the excellent Nyagrodha (Ficus bengalensis), the Parna (Butea frondosa); do thou come to us, O Arundhatī" (a climber, Silācī by name). (V. 5. 5.)

Of these plants it may be a product.

"The berry, remedy for what is bruised, remedy for what is pierced—that did the gods prepare; that is sufficient for life." (VI. 109 1.)

The plant is Pippalī—Piper longum.

5. Plants used against the Venom of Snakes and other Insects.

It is the proud distinction of the Indian system of medicine that it has provided for the

treatment against poison of snakes und other insects—a provision which is absent in some of the most advanced systems of medicine to-day. Even in this rudimentary state of the medicinal science with which we come across in the Atharva Veda we find that the poison of snakes has received attention in detail. The kind of snakes

from which men were in constant apprehension of danger are distinctly mentioned.

The hymns dealing with medicine for venomous bite yields a harvest of historical results

giving us the important truths that there was

a distinct class of people treating patients suffering from snake-bites, that the Kirūtas, perhaps a billy tribe, were discoverers of these remedies.

The very interesting thing in this connection is that the cure is not only all-comprehensive and radical but also vindictive, the agent of the mischief, the snake, being compelled by virtue

of the remedy to take the poison of its own bite—thus the devil being hoisted with its own petard. This process might be regarded as an ancient anticipation of the modern process of auto-vaccination both being based on precisely the same principle of vishasya vishamaushadham—poison is the antidote against poison. This wonderfully useful but academically unrecognised Science of Cure against snake-bite

is successfully practised by illiterate but skilful

exoreists in obscure corners of this country. The germ of snake worship as represented by the modern $V\bar{a}stu$ and $Manas\bar{a}$ $P\bar{u}j\bar{a}$ may be traced in one of the verses.

"With sight I smite thy sight; with poison I smite thy poison; die, O snake, do not live; let thy poison go back against thee." (V 13.4.)

"The eared-hedgehog said this, coming down from the mountain; which soever of these are produced by digging, of them the poison is

"From the crosslined [snake], from the black snake, from the adder [what is] gathered—that poison of the heron-jointed one hath this plant made to disappear." (VII. 56.1)

The plant intended is "Madhuka" which is

the name of various trees and herbs-Bassia

most sapless." (V. 13. 9.).

atifolia.

"The little girl of the Kirātas, she the little one, digs a remedy, with golden shovels, upon the ridges of the mountains." (X. 4. 14.)

"Hither bath come the young physician

"Hither hath come the young physician, slayer of the spotted ones, unconquered; he verily is a grinder-up of both the constrictor and the stinger." (X. 4. 15.)

"Whichever of the snakes [are] fire-born,

stinger." (X. 4. 15.)

"Whichever of the snakes [are] fire-born, herb-born, whichever came hither [as] water-born lightnings; those of which the kinds are variously great—to those serpents would we pay worship with reverence" (X. 4 23)

Remove thou it from every limb make (t)

avoid the heart: then, what keenness the poison has, let that go downward for thee." (X. 4. 25.).

6. For securing Prosperity and Prolongation of Life with Plants.

The Indian science of medicine deals

with remedies both positive and negative, both

preventive and curative. It takes into account man, not only in a state of disease but also in a state of health It aims both at security and the prolongation of life. And in some of the hymns of the Atharva, we find mention of plants which either by themselves or in association with incantations lead to longevity. Most important of these plants are Aparājitā, Parno, Palāśa, Aśwattha, Tāliśa and Simsapā. Prosperity is sought to be brought about by the defeat of foes too, which, curious as it might seem, could be brought about by the use of plants possessing supernatural properties. The plant Aparājitā (Clitoria ternata) is, as its etymology shows, born to grant invincibility, and the practice prevalent in Bengal of using it round one's upper arm on the great Bijoyā day is a revival of the past practice. The dead past is still living in the living present. Quotations

made below bear on the above remarks:

"Indro put thee (Aparāiitā) on his arm, in order to lay low the Asuras smite the dispute

المالم

of (my counter disputant make them sapless O herb. (II. 27. 3.,

"Indra consumed the pāthā, in order to lay low the Asuras, etc." (II. 27. 4.)

The plant is $P\bar{a}th\bar{a}$ (Clypea hernandifolia).

"The Parno (Butea frondosa), Soma's formidable power, hath come, given by Indra, governed by Varuna; may I, shining greatly, wear it in order to length of life for a hundred autumns." (III. 5. 4.)

"As thou, O Aśwattha (Figure religiosa) didst break out the Khauira (Acacia catechu) within the great sea, so do thou break out all those whom I hate, and who hate me." (III. 6. 3.)

"Thou art the highest of herbs ($T\tilde{a}li\delta a$ plant); of thee the trees are subjects; let him be
our subjects who assails us" (VI. 15. 1.)

The plant is $T\bar{a}li\hat{s}a$ -Flacourtia cataphracta.

"If with eye, with mind, and if with speech we have offended waking, if sleeping, let Soma purify those things for us with Svadhā."

(VI. 96 S.)

"Me with a portion of Simšapā, together with Indra as ally, I make myself portioned; let the niggards run away." (VI 129 1.)

The plant is Dalbergia sisu.

7. Plants used for virility and Erotic Success.

The vital importance of the problem of

virility was recognised by the Ancients in India and their medical science, even in its infancy, attacked it, and found out remedies both for increasing man's virility on the one hand and for destroying it on the other. In harmony with the spirit of the time the aid of medicinal plants used to be called for in impairing the virility of the opponents—a fact characteristically symptomatic of the then state of civilisation and culture. Very allied to the problem of virility is the problem of amatory success and we find a large number of plants mentioned in the Atharvanic hymns applied for the purpose, of course with supernatural aid in the shape of invocations and incantations. The following hymns deal with these top.cs

Book I, 34—A love spell with a sweet herb used in a ceremony for superiority in disputation.

Book III, 18.—Against a rival wife with a plant.

Book IV, 4.—For recovery of virility.

Book VI, 72.—For virile power.

,, ,, 101—,, ,, ,,

,, ,, 138—To make a certain man impotent.

", ", 139—To compel a woman's love Book VII, 38—To win and fix a man's love with a plant The qu tations male below will illustrate the general spirit and tenor of these hymns:

"About thee with an encompassing sugarcane have I gone, in order to absence of mutual hatred; that thou mayest be one loving me, that thou mayest be one not going away from me."

(1.34.5)

(1.0±0.)

The plant is Madhuka—Bassia latifolia or Yasthimadhu—Glycyrrhiza glabra.

"I dig this herb, of plants the strongest, with which one drives off her rival; with which one wins completely her husband." (III 18.1)

(A hymn exactly parallel to this is found in Rig Veda)

The plant is $P\bar{a}th\bar{a}$ or $V\bar{a}napar\eta\bar{\imath}$ —Clypea hernancifolia.

"Of the horse, of the mule, of the he-goat and of the ram, also of the bull what vigours there are—them do thou put in him, O self-controller." (IV. 4. 8)

The plant used is identified with Kapitthaka (Feronia elephantum.)

"As the black snake spreads himself at pleasure, making wondrous forms, by the Asura's magic, so let this Arha suddenly make thy member altogether correspondent, limb with limb." (VI. 72.1.)

The plant is identified with the Arka plant—Calotropis gigantea.

Wherewith they invigorate one who is lean,

MALADIES-PHEIP CLASSIFICALONS

wherewith they incite one who is ill with that O Brahmanaspati, make thou his member taut like a bow." (VI. 101.2.)

(The amulat of Arka wood.)

- "Thou art listened to, O herb, as the most best of plants: make thou now this man for me impotent, opasa-wearing." (VI. 1381.)
- "A conciliator, a love-awakener, do thou, O brown, beauteous one; push together both you woman and me; make our heart the same." (VI. 139.3.)

The plant is Andropogon aciculatus.

"If thou art either beyond people, or if beyond streams, may this herb, having as it were bound (thee), conduct thee in hither to me." (VII. 38.5).

The plant is Sankhapushpikā-or hemp.

SECTION IV

MISCELLANEOUS USES OF PLANTS

1. Utility of Plants in the Growth of Hair.

Over and above the branches dealt with in previous sections of the paper, the verses of Atharva Veda contain a variety of uses to which plants used to be put. We place this under the head "Miscellaneous uses of plants." One of these topics is "the growth of hair." It is the outstanding merit of medical science in India that even in its infancy it took a due note of the vital relation of the body and the soul as also of the vital importance of considering its æsthetic aspects, and hence cosmatic consideration plays a part therein. Some hymns of the Atharva Veda mention plants used for contributing to the preservation, growth, development and nicety of hairs. The following extracts will give us an idea of the thing.

"O thou of great leaves, blessed one, rainincreased, righteous! as a mother to her sons, be thou gracious to the hair, O Samī." (VI. 30.3.)

(Prosopis spicigera and Vimosa suma)

Fix thou the old ones generate those unborn, and make longer those born." (VI. 136.2.)

"What hair of thine falls down, and what one is hewn off with its root, upon it I now pour with the all-healing plant" (VI. 1363.)

"Fix thou the root, stretch the end, make the middle stretch out, O herb: let the black hairs grow out of thy head like reeds" (VI. 137 3.)

2. Bk. X. 3. With an amulet of Varana (Crataiva Rosburghii)

This hymn of the Atharva Veda gives us the use of a plant employed for manifold purposes: the prevention of injury, atonement for hereditary sins, warding off foes, and the attainment of prosperity. The following quotations will amply bear us out:

"This Varana is my rival-destroying, virile amulet; with it do thou take hold of thy foes, slaughter thy injurers."

1.

"From the niggard, from perdition, from sorcery, also from fear, from the more violent deadly weapon of death, the Varana shall shield thee"

7.

What sin my mother, what my father, and what my own brothers, what we ourselves have done, from that shall this divine forest-tree shield us" 8.

I be rtms lura a being long lived one of a hundred autumns, may it assign to me both kingdom and authority, to me cattle and force."

3. Bh. XIX. For various lessings with an amulet of Darbha (Poa cynosuroides).

The hymns 28, 29, 30, 32, 33, give us the variety of uses to which Darbha could be put for the purpose of the prolongation of life, for protection, for warding off enemies and for a variety of material blessings. The plant Darbha seems to be identical with modern $K\bar{a}sa$ and Kusa—which is still used for sacrificial purposes.

4. Bk. XIX 31. For various blessings with an amulet of Udumbara (Figure glomerata)

This hymn contains the multiplicity of blessings that the plant *Udumbara* (Ficus glomerata) yields—the blessings of progeny, material prosperity, protection against enemy and lordship over men and other animals. The quotations below will illustrate our remark:

"Let me be the over-ruler of cattle; let the lord of prosperity assign to me prosperity; let the amulet of *Udumbara* confirm to me possessions" 6

MISCELL ANEOUS USES OF LEVILLE 1 1

Unto me the amulet of Ud d t t with both progeny and riches: the amulet quickened by Indra hath come to me together with spleadour."

7.

The plants Jangida in hymns 34, 35; Satuvāra (Asparagus recemosus) in 36; and Guggula (Balsamodendron mukul) in 38,—are mentioned as remedies against diseases and for protection against witcheraft and various other blessings.

SECTION V

DEVELOPMENT OF MEDICAL SCIENCE

Technically, the scientific treatise dealing with medical problems is the Ayurveda or the Science of life. From the statement in the Charaka, Sušruta and other medical treatises, it is clear beyond all possibility of doubt that there must have existed a monumental treatise of the name marking the intermediate period of transition between the Rig and Atharva Vedas on the one hand and the Charaka and Susruta on the other. Without the hypothesis of the existence of such a work, a hypothesis which is very valid, the unbridgable gulf-a gulf of probably a thousand years or more according to Dr. P C. Roy - separating the rudimentary science of Medicine painfully gleaned out of the Vedic texts and the fully developed and scienti-

¹ 'Where the humoral pathology is fully developed, the diagnosis and prognosis of diseases described at length and elaborate mode of class-fication adopted "—Boy History of Hindu Chemistry Vol. I, p viii (1902)

181

authorities traced the origin of the lost work to the Atharva Veda and some to the Rig Veda. but the following statement occurring in the Charaka, seems to be decisive on the point. " If anybody enquires from which of the four Vedas-Pik, Sāma, Yaja and Atharva, Ayurreda.

ie, the Veda of life emanates? What is life? Why the treatise is called the Science of life? Is it transient or permanent? What are the sub divisions of the Science of life, to whom it is open for study and why? A physician when thus interrogated, of all the four Vedas should mention the Atharva Veda emphatically as the Veda of life, i.e., should point out the Ayurveda

as a part of the Atharva Veda for this reason that the Atharva Veda bas prescribed treatment by gift, expiation, sacrifice, atonement and fast, as well as incantations, and has prescribed treatment solely as conducive to the welfare of life, etc "

"It is called the Ayurvedu or the Science of life because it enables us to understand what Ayu or life is If asked how it explains life, the answer is this :-- it is called Ayurveda because it brings home to us the nat re of Ayu by characterisation, by happiness, by misery, by good and

evil, and by positive and negative proofs."

The Susruta coming after Charaka precisely agrees with it in describing the same genesis of Ayurveda.

Those who hold to the Rig-Vedic origin of the Science of life pointed out to the repeated mention of Rudra as the father of the Science of Medicine in the Rig Vedic texts (II. 7. 16) This view is echoed by later mythological literature, and the traditional association of Rudra with the healing science has been systematically maintained. Whatever that may be, the Atharvanic origin of the Science of life, the tracing of the genesis of the Charaka and Susruta to the Atharva Veda seems to be warranted by facts. The divisions of the Science of Medicine as occurring in the Charaka and Susruta are as follows:—

- (1) Salyatantra (Major Surgery);
- (2) Sālakyatantra (Minor ,,);
- (3) Kāyachīkītsā (Medicine);
- (4) Bhutaridyā (Demonology);
- (5) Kaumānuvidyā or the Science of Pædiatrics;
 - (6) Agadatantra or Toxicology;

¹ Sušruta 1 1 3

^{- &}quot;Rigredavijāuri eda uparēda"—Caranavyuha by Vyāsa Âyūrveda Patrikā—Âymveder mūltatwi, tālij B.S., Vol. I Cf. also Devīpuraņam, Chapter 107, p. 297, Bangibāsī edition

Charaka I XXX. 15 Sufruta I 2 3

- (7) Rusayana or the Science that treats of prolonging life; and
- (8) Vājīharaņatantro or the Science of Aphrodistaes, i.e., treatment to stimulate the sexual power.

And these precisely correspond to the divisions of this science in its rudimentary stage as we have deduced in a previous section of this paper from the verses of the Atharva Veda.

The further story of the science of Medicine in India can be very briefly told. It is the story of monotony and stagnation-no development, no progress, no practical addition, rather, the spirit of enquiry, the desire of explanation, a hankering after the solution of each problem, the motive of searching analysis and scrutiny are all gone. In the Hindu Science of Medicine, Mythology with its vast array of gods and goddesses intrudes; and although the Science has been practised, and it is being practised still with wonderful efficacy, the progress has been arrested for good and all. The wonder of wonders is that the Indian Science of Medicine which was developed centuries before the modern Science of Medicine came into being, has stood so long the wear and tear of time, of revolutions and conquests and in all essentials is still as perfect as 'the most developed European system to-day and, considered from the point of utility it is peculiarly useful and

efficacious to the people of the land of its origin. The glory of it is that it can still cope with any other system of medicine and the misfortune and shame of it is that it has not received adequate attention and has not consequently undergone any improvement.

BOOK III BOTANY AND SCIENCE OF AGRICULTURE

SECTION I

GENERAL OBSERVATIONS

The ancient Botanical Science and the ancient Science of Agriculture are so closely connected and interwoven with each other in Indian thought and practice, at any rate in the period of its infancy, that they cannot be well separated. In the present book we shall attempt a study of the historical development of the ancient Science of Agriculture with the object of incidentally illustrating the corresponding development of an aspect of the Botanical Science.

Agriculture requires the agency of three factors: the soil to be cultivated, the cultivator and the objects to be cultivated. All these three requisites are eternal and unchangeable in all ages and under all circumstances.

SECTION II

Beginnings of Agricultural Science

in a hymn of the Rigveda which definitely shows us that India was peculiarly fit for Agriculture which was then the staple industry of the country, the sole source of the supply of

The earliest mention of Agriculture occurs

food and the universal occupation of the people. The northern India being very fortunate in supply of water owing to the existence of a net work of rivers, yielded crops with ease and in

abundance; and the cream of the population, the highest section of the race, namely, the Brahmin *Rishis*, regarded agriculture as a holy

and dignified occupation.

The following hymn from the Rigveda shows that agriculture constituted a theme of inspired speculation:

that agriculture constituted a theme of inspired speculation:

"With the master of the field, our friend, we triumph: may be bestow upon us cattle, horse,

nourishment, for by such (gifts) he makes us happy."

"Lord of the field, bestow upon us sweet, abundant (water), as the milch cow (yields her)

milk, dropping like honey, bland as butter: may the lord of water make us happy." 2.

Rigvoda IV XII (LVII)—W son Vol III pp 224 225 (1857)

AG RICULTURAL SCIENCE BEGINNINGS 193 May the herbs (of the field) be sweet for us may the heavens, the waters, the firmament, be kind to us; may the lord of the field be gracious to us · let us, undeterred (by foes), have recourse to him." 3. "May the oxen (draw happily), the men (labour) happily . the plough furrow happily : may the traces bind happily; wield the goad happily." "Suna and Sira be pleased by this our praise, and consequently sprinkle this (earth) with the water which you have created in heaven." 5. 'Auspicious $S\bar{\imath}t\bar{a}$ (furrow) be present, we glorify thee: that thou mayest be propitious to us, that thou may yield us abundant fruit." 6 "May Indra take hold of Sītā, may Pushan guide her; may she, well stored with water, yield

"May the ploughshares break up our land happily; may the ploughman go happily with the oxen; may Parjanya (water the earth), with sweet showers happily grant, Suna and Sira, prosperity to us."

8.
This shows us very clearly that the Aryans

7.

it as milk, year after year."

This shows us very clearly that the Aryans by the time when the hymn was composed were settled in the fertile soil of North India and realised the vital importance of Agriculture as a staple and national industry for which they took a good deal of care and for which the Divine was invoked. They seem to acquire also a

sound I nowledge of the science as it exists to-day, and a nice handling of the instruments of Agriculture, such as plough, etc From another hymn' quoted below it will appear that they had recourse to artificial water supply when necessary, and, as in modern Europe, used to employ horses as well as cattle in agricultural operations "Awake, friends, being all agreed; many in number, abiding in one dwelling, kindle Agni I invoke you, Dadhikara, Agni, and the divine Ushas, who are associated with Indra, for our protection " 1. "Harness the ploughs, fit on the yokes, now that the womb of earth is ready sow the seed therein, and through our praise may there be abundant food; may (the grain) fall ripe towards the sickle." 3. "The wise (priests) harness the ploughs, they lay the yokes apart, firmly devoted through the desire of happiness." 4. "Set up the cattle-troughs, bind the straps to it; let us pour out (the water of) the well, which is full of water, fit to be poured out, and not easily exhausted." "I pour out (the water of) the well, whose cattle-troughs are prepared, well fitted with straps, fit to be poured out, full of water, inexhaustible." 6

not diminish, he who gives not finds no
consoler."
"He who, possessed of food, hardens his heart
against the feeble man craving the nourishment,
against the sufferer coming to him (for help),
and pursues (his own enjoyment even) before
him, that man finds no consoler." 2.
"He is liberal who gives to the suppliant
desiring food, wandering about distressed; to
him there is an ample (recompense), and he
contracts friendship with his adversaries." 3.
"He is not a friend who gives not food to a
friend, to an associate, to a companion; let him
turn away from him, that is not a (fitting)
dwelling; let him seek another more liberal
lord."
"Let the very rich man satisfy his suitor,

for riches revolve from one man to another as the wheels of a chariot turn round." 5. "The inhospitable man acquires food in vain. I speak the truth—it verily is his death. He cherishes not Aryaman, nor a friend; he who

6

let him look forward to a more protracted route,

"The ploughshare furrowing (the field) provides food (for the ploughman) .(so) let the man who gives become a kinsman to the man who gives not."

The art of Agriculture as it can

eats alone is nothing but a sinner."

The art of Agriculture as it can be gleaned from the verses of the Atharya Veda is practically a reproduction of what we get in the Rik. Thus.

HYMN 17: For Successful Agriculture:

AGRICULTURAL SCIENCE BECONNINGS 19

This hymn begins by asking the poets to "harness the ploughs" and "to extend severally the yokes," and "seatter the seed in prepared womb," and so forth—a fact showing us unmis-

takably that poets in their fine frenzy of a

joyous vision, and wise men in their meditative quest after truth, at least occasionally made time to hold the plough and to cultivate the land as a means of earning the livelihood—food without which no poetry, however excellent, and no philosophy, however grand, is possible. The

picture of the art of cultivation as we get in this hymn does not differ a bit materially from the same art practised by the peasants in India to-day. There is the same mode of ploughing the land, preparing the womb of the earth, cutting

HYMN 24: For Abundance of Grain.8

the corn with the same sickles when they are ripe only with this distinction that the profession was

The hymn is addressed to the god of plenty so that he might favour his worshippers with an abundance of grain

All the hymns of the Atharva Veda referred to in this thesis are from Whitney (1905)

• Atharva Veda Book II p 114

Ath Veda, Book III p 129

that the villagers used a plot of land in common, where they used to graze their cattle, and cultivate the land, and sow and reap the corn collectively. The five races of men referred to may be the five bodies of men—namely, the ploughmen, the sower, the reaper, the gatherer and

the bringer and the distributor. All these were engaged in the common work of cultivation in the most comprehensive sense of the word. The theory of the division of labour seems to have been understood, realised and thoroughly practised by the Ancients. At the very early stage of society a race of invading immigrants, just settled in groups in an unreclaimed land, could not do better than fall upon the method of organisa-

The 5th verse supplemented by the 7th gives us an idea of the village life based on communal principle. It does not seem to be improbable

tion on communal basis—one headman with his band of followers, supervising, controlling and distributing the produce of the common land amongst his followers much after the fashion of a father in a family.

Reading the verses between the lines we can get a clear idea of the village construction with

to come when necessary to carry on the work.
"These five directions that there (village) are,
the five races p cughman, etc descended from

the "village common" in the centre surrounded by habitations on all sides, whence people used AGRICULTURAL SCIENCE BEGINNINGS 195

Manu—may they bring fatness (contribute to the production of abundant grain) together here, as streams drift when it has rained '2 3.

Нүми 15.¹

This hymn conveys a beautiful tribute to rain which is a vitally necessary agency in the luxurious development of herbs and plants. The connection between rain and the growth of corn is gratefully and poetically acknowledged. The condition of Agriculture in India is precisely the same now as it was in the days of the Atharva, and the following invocation of rain might well be put in the mouth of a devout peasant to-day—"let the mighty liberal ones cause to behold together; let the juices of the waters attach themselves to the herbs; let gushes of rain gladden the earth, let herbs of all forms be born here and there;.* .let the herbs become full of delight with the coming

Hymn 50.2

of the rainy season."

This hymn enumerates the animal enemies of corn and invokes the divine aid for their destruction. The locust, the raf, the devourers of corn, and the borers figuring in this hymn are precisely the animals that we meet to-day.

¹ Athurva Veda, Book IV, p. 172. VI p 317

After all from verses I ke these it is clear that the agricultural condition of India, like other conditions, is not materially different from what existed in the days of old

Hymn 142.

This hymn distinctly shows that at one time barley happened to be the staple food of the Indians to the extent of being regarded as a fit object for invocation. And this hymn indicates a note of jubilation at the abundance of the growth of this corn.

Hymn 59². For Protection of Cuttle

This hymn and the one following show how cattle used to be held as precious:

"To the draft-oxen [do thou] first, to the milch kine [do thou], O Arundhatī (the commentator identifies it with Sahadevī), to the non-milch cow, in order to vigour, to the four-footed creatures do thou yield protection." 1.

HYMN 21⁸. Praise of the Kine.

"They shall not be lost; no thief shall harm (them); no hostile (person) shall dare attack their track: with whom he both sacrifices to the gods and gives, long verily with them does the kine-lord go in company."

¹ Atharva Veda, Book VI, p. 387 2 ,, ,, VI, ,, 325 2 , , , IV 187

drinking clear waters at a good wateringplace—let not the thief master you, nor the evil plotter, let Rudra's weapon avoid you." 7.

SECTION III

DEVELOPMENT DURING MAURYA PERIOD

By the 4th century B. C. the art of Agricul-

ture received a consummate perfection. It became an important department of the Government, a special officer, called the Superintendent of Agriculture, being appointed for

the management and supervision of the important industry. This dignitary was to be a man of accurate and scientific knowledge of the

subject, or "assisted by those who are trained in such sciences."

The duty of the Superintendent was a very extensive one. He was to "collect the seeds of all kinds of grains, flowers, fruits, vegetables, bulbous roots, roots, creepers, fibre-producing plants, and cotton." He was to see that the cultivation of the crown land should suffer on no account and enforce laws governing the proper cultivation of the soil.

Chapter XXIV, Sections 117, 118, pp 138-142.

connection with and in the interest of Agriculture over the whole of India seem to be simply marvellous for that age.

"The quantity of rain that falls in the country of Jängala (in the desert countries—

com.) is 16 drons; half as much more in moist countries $(an\bar{u}p\bar{a}n\bar{a}m)$; as to the countries which are fit for agriculture $(d\bar{e}\hat{s}av\bar{a}p\bar{a}n\bar{a}m)-13\frac{1}{2}$ drons in the country of $A\hat{s}makas$ (the countries of Maharashtra—com.); 23 drons in Avanti, and an immense quantity in Western countries $(apar\bar{a}n-1)$

immense quantity in Western countries (aparān $t\bar{a}n\bar{a}m$ —the countries of Konkana), the borders of the Himalayas, and the other countries where water channels are made use of in agriculture ($luly\bar{a}v\bar{u}p\bar{a}n\bar{a}m$). "When one-third of the requisite quantity

culture (kulyāvāpānām).

"When one-third of the requisite quantity of rain falls both during the commencement and closing months of the rainy season (months

of Sravana and Kartika—com) then the rainfall is (considered) very even (sushamārūpam). "A forecast of such rainfall can be made by

observing the position, motion and pregnancy (garbhādhāna) of Jupiter (Brhaspati), the rise set and motion of Venus, and the natural and

the unnatural aspect of the sun. " From the sun, the sprouting of the seeds can be inferred; from (the position of) Jupiter,

the formation of grains (stambakaritā) can be inferred and from the movement of Venus. rainfall can be inferred. "Three are the clouds that continuously rain

for seven days, eighty are they that pour minute drops; and sixty are they that appear

with the sunshine-this is termed rainfall. Where rain free from wind and unmingled with sunshine falls so as to render three turns of ploughing possible, there the reaping of a good

harvest is certain. "Hence, i.e., according as the rainfall is more or less, the Superintendent shall sow seeds which

require either more or less water" (p. 139). The Superintendent was also to see that seeds of crops are properly sown and reared in their proper seasons, in proper fields and under

circumstances and conditions favourable to the growth Thus:

"The Superintendent shall grow wet crops (kedāra), winter crops (haimana, or summer

EVELOPMENT DURING MAURYA PERIOD 201

crops (graishmika) according to the supply of workmen and water.

"Lands that are beaten by foam (phenāghātah, i.e., banks of rivers, etc.), are suitable for growing Vallīphala (pumpkin, gourd, and the like); lands that are frequently overflown by water (parīvāhāntā) for long pepper, grapes (mṛdvīkā), and sugarcane; the vicinity of wells for vegetables and roots, low grounds (haranīparyantaḥ—moist beds of lakes—com.) for green crops; and marginal furrows between any two rows of crops are suitable for the plantation of fragrant plants, medicinal herbs, khuskhus roots (ušīra), hira (?), beraka (?) and pīndāluka (lac) and the like.

"The seeds of grains are to be exposed to mist and heat (tushārapāyanamushnam cha) for seven nights; the seeds of Kōsī (such as mudga and māsha, etc.—com.) are treated similarly for three nights; the seeds of sugarcane and the like (kāṇdabīṇānām) are plastered at the cut end with the mixture of honey, clarified butter, the fat of hogs, and cowdung; the seeds of bulbous roots (kanda) with honey and clarified butter, cotton seeds (asthībīya) with cowdung; and water pits at the roots of trees are to be burnt and manured with the bones and dung of cows on proper occasions.

"The sprouts of seeds, when grown, are to be manured with a fresh haul of minute fishes and

duty.

irrigated with the milk of Snuhi (Euphorbia antiquorum).

"Sāli (a kind of rice), Vrīhi (rice), Kodrava (Paspalum scrobiculatum), Tila (sesamum), Priyangu (panic seeds), $D\bar{u}raka$ (?) and Varaka (Phaseolus trilobus) are to be sown at the commencement $(p\bar{u}rv\bar{a}v\bar{a}pah)$ of the rainy seasons. Mudga (Phaseolus mungo), $M\bar{a}sha$

(Ph. radiatus) and Saivya (?) are to be sown in the middle of the season. Kusumbha (Safflower), Masura (Ervum hirsutum), Kulattha (Dolichos biflorus), Yava (Barley), Godhūma (wheat), Kalāya (Leguminous seeds), Atasī (linseed), and Sarshapa (mustard) are to be sown last."

The Greek ambassador at the Court of Chandra Gupta—Megasthenes—a contemporary of the author of Arthasāstra, pays 2 an eloquent tribute to the abundance of crops in India, to the fertility of the soil, to the absence of famine

and the peculiar respect in which agriculture and the agriculturists were held. Even at the time of war the combatants used to leave the agriculturists undisturbed as a matter of

L'AGUENT AL

Or the fe tility of Ind a

"During the rains flax is sown, and millet, also sesamum, rice and bosmorum, and in the winter time wheat, barley, pulse and other esculent fruits unknown to us" 1

The grandson of Chandragupta, Asoka, as it is clear from one of his edicts 2 looked upon the encouragement of agriculture not only as a political duty (as Chandragupta did) but also as a moral duty.

- ¹ Other foreign observers also dwell upon the perfection of agriculture and the tertility of the soil in India. Thus Strabo, coming long after Megasthenes, remarks
- "During the rainy season flax and millet as well as bosmorum are sown and in the winter season wheat, barley, pulses and other esculents with which we are unacquainted."
- "They (Nearchos and Aristoboulos) add that the land while but still halt died is sown, and though scratched into furiows by any common labourer, it nevertheless brings what is planted to perfection and makes the fruit of good quality. Rice according to Aristoboulos stands in water, and is sown in beds. The plant is 4 cubits in height, has many ears and yields a large produce. Megillos says that rice is sown before the rains, etc."

Strabo, Ancient India McCrindle (1901), Secs. II-IV, Bk. XV, 13, 18

2 "Everywhere in the dominions of His Sacred and Gracious Majesty the King, as well as among his frontagers, the Cholas, the Pāndyas, the Satyaputra, the Ketalaputra as far as the Tāmbaparnī, Antiochos, the Greek king or even the kings, the neighbours of that Antiochos—everywhere have been made the healing arrangements of His Sacred and Gracious Majesty in two kinds, (namely) healing

the agricultural interest of the country became codified 1 into a law, and a special class of people versed in the knowledge of correct measurement and weight, as also good and bad qualities of the soil, sprang up known as Varévas. Thus:

By the time of Manu the duty of looking to

"If the land be injured by the fault of the farmer himself, as if he fails to sow it in due time, he shall be fined ten times as much as the King's share of the crops that might otherwise

have been raised." Code \ III. 243. "Again a Vaisya must be skilled in seeds, and in the bad or good qualities of land and the correct modes of measuring and weighing."

Code IX, 330.

arrangements for men and healing arrangements for beasts. Medicinal herbs also, both medicinal herbs for men and medicinal herbs for beasts, wheresoever lacking have been everywhere both imported and planted. Roots also, and fruits wheresoever lacking have been everywhere imported and planted. On the roads too wells have been dug and trees planted for enjoyment of men and beasts."

SECTION IV

Khishi-Parasara

A very valued treatise called Krishi-Parāśai a of uncertain date, but composed certainly not

later than the 5th century A.D., devoted principally to the plantation of paddy and secondarily to other things concerning agriculture, throw a flood of light upon the perfection attained by the Art of Agriculture in India. It deals with such topics as meteorological observations leading to the prediction of the scarcity, drought and abundance of rain; superintendence of the field and its produce; tending of the herd needed for cultivation; preparation and application of manure; the construction of agricultural implements, collection of seeds; sowing; harvesting. etc., etc. This treatise is all-comprehensive being full of a large number of pregnant aphorisms relating to the minutest particulars

of agricultural processes.

A verse 1 concerning the ploughing of land runs:

"By ploughing the land in autumn one gets the goodliest of harvests (golden) and by

> " इंगने क्रथते इन नतके तासरीयकम् । यान् निराधकाचित् द्रारिद्रान्त प्रनामनि ॥

ploughing it in spring one gets the next best (copper and silver), by ploughing in summer one gets simple paddy (i.e., of the third order), and ploughing in the rainy season one gets absolute dearth."

There is another 1 relating to the sowing of paddy:

"The month of Buršakh is the best time for sowing seeds of paddy, the next is Jarshtha, Ashār is bad for the purpose and Srāvaņ is the worst."

Here is another 'telling us how to manure the land.

"After sunning the manures and grinding them in the month of $M\bar{a}gh$ one should bury them in the fields in the month of $F\bar{a}lgoon$ and then on the eve of sowing should apply them to the soil, else the yields of crops will not increase."

^{1 &#}x27;'वैशाखे वदन कोष्ठ' केष्ठे तु सध्यमं स्मृतम ।

विना सारिक सद्दास क्द्रीते मुष्ठक्रधि ॥

Let us quote last a verse from Krisl i Parasara concerning the construction of the plough.

"पचहस्तो सवेदोशः स्थाणः पचितिस्तिनः । सार्षेत्रस्तसु निर्योतः युगः कर्णसमानकः ॥ निर्योत्तपायिका चैव श्रव्डचत्तस्तयेव च । दाद्याङ्गुलिमानोहि शोलोऽरित्नप्रमाणकः॥ सार्वेद्वाद्यमुष्टि वी कार्या वा नवमुष्टिका । दृद्ग पचिनका ज्ञेया लीक्षाया वंशस्थवा ॥''

V ACTURE

KTINAS MAZIMS

The striking resemblance between some of the aphorisms of Khanā relating to agriculture and some of the verses in *Krishi-Parāśara* on the same subject may warrant us in the supposition that the authentic treatise in Sanskrit might have a good deal to do with the mythical author of the aphorisms of Khanā who has carried the lessons contained in the *Krishi-Parāśara* to particular applications in minute details.

The aphorisms of Khanā bearing on agriculture may be classified under the following heads:

- 1. General maxims governing the conduct of the cultivators. 2. Meteorological observations with a view to the guidance of the farmers 3. Selection of the soil. 4. Ploughing. 5. Sowing and planting. 6 Reaping and harvesting, etc. The number of maxims under each of these heads is too large to be given except in typical selections.
 - 1. General Maxims governing the Conduct of the Cultivators.
- "The master who gets the soil cultivated either by himself or in co operation with others

reaps the full harvest, and next the man who gets the same done by others, himself standing with umbrella spread over his head (i.e., without taking part himself), and the man who sits at home and takes care of his soils thence (i.e., who takes only a theoretical care of his soil) is fated to a life of penury."

"The cultivation should be conducted in co-operation of the father with the son, and failing that of a brother with a brother."

The whole drift is that the cultivation should be done by men themselves directly interested in the prosperity of the harvest.

- 2 Predictions as to the Influence of Timely and Untimely Showers upon the Crops.
- "If it rains in the month of Agrahāyaņ the very king is driven to begging, and if in Pous the husks are sold in their weight in gold, and if in the month of Hāgh, the country might be regarded as blessed and the sovereign might be congratuated thereon: and if in Fālgoon, Chinā and Kāon (grains) will grow very plentifully"
- "The year in which it rains cats and dogs on the ninth day of the full moon in the month of $\hat{A}sh\bar{a}r$, the crane will walk over the very bottom of the sea (i.e., absolute drought will visit the land); O! Father-in-law, you need not bother yourself about the farther calculation in this matter. If it drizzles on that day it

212 PLANTS AND PLANT LIFE

will be followed by a heavy shower of rain throughout the whole year to the extent of making the fish inhabit the tops of mountains (i.e., whole country will be over-flooded). If it rains now and then throughout the year the very earth will not be able to bear the weight of

the harvest. If the sky remains clear at the setting of the Sun the farmer will have to sell his bullocks in the market, i.e., the corns will not grow at all."

"Drought in Jaishtha and shower in Ashār lead to the growth of corn too plentiful for the

earth to bear."

"If wind blows from the north-east at the beginning of the year it is sure to have a good shower according to Khanā."

good shower according to Khanā."

"Khanā says this to the cultivator that if fieecy cloud be followed by wind in the full moon in the month of Kārtik the winter crops will grow too plentiful for the earth and if there be both

cloud and rain at night it is altogether useless to go to the field, i.e., the crops will not grow."

3. Selection of the Soil.

As the Soil of Bengal is unusually fertile, being fit for all kinds of crops, the maxims of Khanā which have almost solely Bengal in view

are too few under this head.

"You worthy cultivator, your aim will be fulfilled if you grow Patol (Trichosanthes dioica) in the sandy alluvial soil

The second secon

The sandy soil is fit for the cultivation of Aus paddy and clayey soil for that of Jute."

"If you grow Arum on the bank of a river it will grow to the height of three cubits, *i.e.*, it will flourish well."

4. Ploughing the Land for Crops.

Elaborate attention is given to the methods of ploughing, thus:

"One should plough the soil sixteen times (i.e, many times) for radishes; half the number of times for cotton; and half of that for paddy and none at all for betel."

"One should cultivate the soil for radishes making it as soft as cotton, *i.e.*, to the extremity of softness and for sugar-cane plough it to the dust."

"Khanā directs, O cultivators, begin the ploughing from the east and surely all your aims shall be fulfilled."

"The man who sets his hands to the plough either on the days of the full moon or the new moon, will be fated to suffer sorrows throughout the whole life. His bullocks will suffer from gout (i.e., remain inactive), and he will suffer from eternal lack of peace. He who violates this injunction of Khanā will do so at his peril."

5. Sowing and Planting.

The treatment under this head is both exhaustive and elaborate.

- "By sowing paddy in the month of $Ash\bar{a}r$ one gets a full harvest, in $Sr\bar{a}van$ only leaves and no fruits, in $Bh\bar{a}dra$ only husks and in $\bar{A}swin$ nothing."
- "Sow paddy to your heart's content throughout the whole of $\Im r \bar{a} v a n$ and the first 12 days of $Bh \bar{a} dra$."
- "During the last four days of Bhādra and the first four days of Āświn sow Kalāi (Phaseolus var. radiatus) as much as you can (i.e., best time)."
- "One should sow Peas after the first 19 days of *Aswin* and within the first 19 days of *Kūrtik*."
- "Khanā directs, good cultivator, sow mustard towards the end of Autumn."
- "The cultivator who does not plant either in the month of Bhādra or Āświn and idles away his time and then too late in the month of Kārtik and Agrahāyan plants grown-up things in the field, is fated to see them perish from an attack of mildew and his barns empty"
- "Sow turmeric in Baisākh and Jaishtha, bidding adieu to your chess-playing, weed out your soil in Ashār and Srāvan so as to make it perfectly fit in Bhādra, otherwise no harvest wil follow

This is the direction of Varaha's son Mihir: Excepting Chaitra and Baiśākh plant brinjals very cheerily throughout the other ten months. Apply ashes, if the plants are attacked by worms as the only remedy, pour water in case the ground is dry, and you will get fruits all the year round.

"Plant betel in $Sr\bar{g}van$ and the produce will be too much to be chewed up even by $R\bar{u}vana$ "

"Patôls will doubly grow if planted in Falgoon.

"Plant plantains in holes one cubit deep each at intervals of 8 cubits, and do not cut off the leaves and it will yield you both bread and clothes."

6 Reaping.

The following maxims selected from among the rest contain directions for reaping the harvest.

"Corns ripen within 20 days after the first appearance of the ear, and one should cut and thresh the corn in 10 days more."

"The corn ripens 30 days after the first appearance of the spike, 20 days after the first appearance of flowers and 12 days after the ears are down after the appearance of a horse's head. Remember this, father-in-law! while making,

buying and selling corns'

"During the last 8 days of Falgoon and first 8 days of Chaitra one should reap the ripe sesamums."

"Cut the hemp plant (for the fibre) as soon as it flowers; the jute when it is mature; and autumn paddy if reaped during the month of Pous proves profitable."

SECTION VI

AMARAKOSHA ON AGRICULTURE

The last comprehensive glimpse of the Art of

Agriculture we get in the Lexicon of Amara which gives us an all-comprehensive information about the subject in the chapters called Bhūmi-

varga, Vanaushadhivarga and Vaisyavarga,

In the Vaisyavarga he deals with the class of people one of whose professions was agriculture. In the hierarchy of castes the Vaisyas, the third in order, have come by this time to be

exclusively professional cultivators of the lands, one of their names being Bhūmispriśah (भूमिस्प्र:), i.e., who touches (cultivates) the land, the husbandman being called Kshetrājivah (चेत्राजीव:).

Next, in the Bhūmivarga, he gives us a general classification of the soils based on fertility The soil is called Myttika (मृतिका); and excellent soil Mrtsā (मृत्सा) : a fertile soil with

every crop Urvvarā (डब्बेस्) or Sarvašasyādhyā (सर्वेशस्याका) ; a salt ground—Kshāra mittikā (चार-स्तिका); a spot with such soil *Ūshavānūshara* (जववानवर); barren soil—Anurvvarā (अनुव्य रा);

a region devoid of water Maru (सन्); untilled or waste land—Aprahate, Khile (अप्रइते, खिले); the soil watered by a river—Nadī-mātrikā (नदीमाहका) and that watered by rain Deva mātrikā (देवमात्वका).

This is a nomenclature which is at once suggestive, exhaustive and sound, displaying a perfect mastery over the fundamentals of agriculture so far as the soil is concerned

Then he gives us, in the Vaisyavarga, again different names for the different kinds of soils

peculiarly fit for the cultivation of different

PLANTS AND PLANT LIFE

218

kinds of crops—a fact from which we can incidentally gather a knowledge of the staple agricultural products of India which is not substantially different from those that we see to-day. Thus he calls the field fit for cultivating corn

and rice, Kshetram vraiheya śāleyam (चेतं बैहेय-शालेयं); that fit for barley as Yavyam, Yavakyam (यथं, यवक्यं); that for Sesamum as Tilam, Tailīnam (तिलं, तैलोनम्); that fit for other grains, pulses, such as, mungo, lentil, gram, etc., as Maudginom, Kaudrabīnā (मोह्नोनं, कोद्रवीना). etc. A field is called Baprah (वप्र:), Kedāra (केदार:),

Kshetram (चेत्र'); a multitude of fields Kaidā-rakam (चेत्रारकम्); land twice ploughed is called Dwigunākritam (इंगुणाक्रम्); thrice ploughed Trihalyam (विह्लां), Trisityam (विह्लां); and anyhow ploughed or tilled Sityam (मोत्यम्), Krishtam (क्रष्टं); a field sown with certain measure

of seeds Drounskāḍhukskā (ट्रोपिकाइकिका) and land ploughed after sowing Vījākritam (tu) Prakrishṭam (वीजाकतं (त्) प्रक्रप्रम्).

¹ In this connection might be added the following directions from the Matsya Purāṇem as to the selection of soils favourable to the

In this connection might be added the following directions from

The soil which takes

a longer time than this must be abandoned for good and all " Matsyapuranam Bangaban Bd. 1816 B S., Chap 258 Slokas 17 18,

SECTION VII

CONCLUDING REMARKS

Our survey of the genesis and development of ancient Science of Agriculture shows that after it has reached a certain state of perfection there has been no further improvement in the method of cultivation, no accurate observation and no useful experiment. The scientific principles underlying the Art under unfavourable political circumstances came to be forgotten and agriculture instead of being a concern of the State, a matter of expert knowledge, came to be the occupation of the lowest strata of the population with the result that the fertile India noted by Megasthenes and others for its absolute absence of famine became repeated scenes of dearth and famine during the Mohamedan rules again and again, and many times during the British rule too.

CONCLUSION

The thesis submitted is but a part of a larger work which is to follow. It is intended to serve as a mere sample of the kind of work which can be produced with the materials that can yet be gathered from the unexplored field of Indian literature and current traditions. The indebtedness of human civilisatian to plants and the study of plant-life is indeed very great. There is hardly any department of human culture, or any phase of human civilisation, whether it be pure poetry or pure philosophy or pure religion, science, art, language, dress and ornament, trade or agriculture, where plants and the study of plant-life have not played an important part.

Our thesis contains, we hope, sufficient evidence to show that the knowledge of Botany developed on three different lines, first, in and through various philosophical speculations; secondly, as Bheshaja Vidyā, in and through the Science of Medicine; and thirdly, as Vrikshāyurveda, in and through the Science of Agriculture. There are quotations from sources referring to some independent treatises, or manuals of the Science of the medicinal properties of plants, those of the Science of Agriculture, as well as works dealing with the treatment of

plants and other topics falling within the province of Botany. We have only glimpses of these manuals and works through the summaries and incidental references in other treatises which are non-Botanical. Even that which survives

or remains, clearly indicates that the division of knowledge by water-tight compartments was yet unknown.

The inter-relation among the sciences was universally recognised, and the sciences and arts developed together. The obstacle in the path of development of the Botanical Science as a full-fledged science, was that scientific cognition and results of observations were not kept sufficiently distinct from the popular notions, guesses

Our study tends to prove that the Science of Plants and Plant-life in India is one of the earliest, if not the earliest one. With it developed such collateral sciences as those of Medicine and Agriculture. We know a good deal more of the Science of Medicine than of the Science of Agriculture, its sister, and of the Science of Plant and Plant-life, its mother. Our survey, however, shows that all these shared the same fate of a

and superstitions.

certain stage, and a tragic stagnation.

The field is vast, our survey is brief but enough, we think, to hold out the prospects of a rich harvest that can be reaped by the modern

brilliant beginning, a marked progress to a

inquirer. The value of the work is primarily historical no doubt, enabling one, as it does, to be acquainted with the circumstances and the difficulties through which human knowledge and art grew up, but its value also consists in discovering different systems of nomenclature and classification, suggestive of different trends of human thought and national culture.

OPINION

I have gone through the essay on "Plant-'ife, etc.,'' submitted for the Griffith Memorial Prize for 1925.

The author has evidently ransacked all the

available sources of old Sanskrit literature from the Rik and Atharva Vedas down to the period when the decline of Arts and Science took place 'n India. Even the aphorisms of Khana-a repository of worldly wisdom and experiencehave been laid under contribution, and an .dmirable capacity for research has been displayed. As the author is conversant with the nodern science of Botany, he has been able to do ample justice to his theme. The collection of technical terms alone constitutes a valuable contribution. In my opinion the author richly deserves the Prize. I would also suggest that the essay be published by the University as a valuable monograph in a practically unexplored ield.

P C. RAY.

I have examined the thesis entitled "Plants and Plant-life as in Indian Treatises and Traditions" submitted for the Griffith Memorial

u

Prize for 1925. The author has explored a vast field of

Sanskrit literature (including English reviews and commentaries on early Sanskrit works) and collected a mine of information replete with gems of botanical facts and aphorisms. The

essay embodies not merely a collection of fragments of early speculation on plant-life but a

critical survey of the botanical knowledge of the Hindus and its application to Medicine and Agriculture, in the searchlight of modern Science. The author has, with the grasp of a trained botanist, succeeded in marshalling evidence to show clear indications of possession by

the ancient Hindus of such knowledge of plant-

life as prognosticate the dawn of science. The thesis is a most creditable specimen of work in a field of research of great promise, and I consider the author as highly deserving of the prize.

S. C. MAHALANOBIS.
